## Acknowledgements

Sincerest of gratitude and appreciation to all of the Palm Beach County partnering organizations and residents who participated and contributed to this effort. By sharing their experiences and opinions, these individuals gave a voice to their community and will inspire change for the future of Palm Beach County. Thank you to all who participated and who work to continuously understand and improve the health of Palm Beach County.

This Palm Beach County Community Health Assessment is dedicated to the residents of Palm Beach County.
"You don't make progress by standing on the sidelines...You make progress by implementing ideas."
-Shirley Chisholm

## Executive Summary

The goal of Palm Beach County Community Health Assessment is to identify unmet health needs of community residents and to inform and guide future health planning initiatives to meet those needs within the county. In 2021, the Health Care District of Palm Beach County and the Florida Department of Health in Palm Beach County engaged the Health Council of Southeast Florida (HCSEF) to facilitate a comprehensive, county-wide health needs assessment for Palm Beach County. As part of the Community Health Assessment Report, data was collected and analyzed at a county level. HCSEF also collected, compiled and analyzed primary data to capture the community's perspective.

This report is organized into four main sections and their description and highlights can be seen in the table below.
Table 1: Community Health Assessment Key Insights

| Section | Description | Highlights |
| :---: | :---: | :---: |
| Demographic and Socioeconomic Profile | The Demographic and Socioeconomic Profile includes data on many of the key demographic and social and economic status indicators, such as population, income, poverty status, educational attainment, employment, housing and transportation | - Palm Beach County had a population of $1,465,027$ residents in 2019, representing about $7 \%$ of Florida's total population <br> - Palm Beach County was slightly more diverse than the state in terms of race with $18.7 \%$ and $16.1 \%$ of their total populations represented by Black residents, respectively; however, it had a smaller proportion of Hispanic residents compared to the state ( $22.4 \%$ and $25.6 \%$, respectively) <br> - In 2019, Palm Beach County had a lower proportion of residents living below the poverty level compared to the state ( $12.2 \%$ and $14.0 \%$, respectively); however, there were significant economic disparities, with the higher proportion of those living in poverty among Black residents and Hispanic residents of any race <br> - Palm Beach County had slightly higher educational attainment compared to the state; however, there are education-related disparities, with $20.1 \%$ of Black residents compared to $40.2 \%$ of their White counterparts and $24.6 \%$ of Hispanic residents compared to $44.3 \%$ of their non-Hispanic counterparts having a bachelor's degree or higher |
| Health Status Profile | The Health Status Profile provides details on various indicators including: COVID19; maternal and child health (such as prenatal care, birth rates, infant and fetal mortality, child immunization rates); behavioral health; hospital utilization; and | - The COVID-19 age-adjusted death rate in 2020 was 2.5 times higher among Black residents than their White counterparts and two times higher among Hispanic residents than their non-Hispanic counterparts <br> - The infant death rate was 2.4 times higher among Black residents and 4.1 times higher among non- |

## Methodology

In 2021, the Health Care District of Palm Beach County and the Florida Department of Health in Palm Beach County engaged the Health Council of Southeast Florida (HCSEF) to facilitate a comprehensive health assessment for Palm Beach County to identify health indicators within the community that present areas of concern, gaps in care or services and opportunities for improvement. Specifically, the Community Health Assessment includes information and data on the following areas:

- Demographic Characteristics
- Socioeconomic Characteristics
- Maternal and Child Health
- COVID-19
- Behavioral Health
- Death, Illness and Injury
- Infectious Diseases
- Health Resource Availability and Access

This report includes quantitative secondary data from national, state, and local database systems and primary qualitative data. Quantitative data were obtained from secondary sources, including but not limited to the: U.S. Census Bureau, Florida Agency for Health Care Administration (AHCA), Florida Department of Health (FDOH), Florida Department of Children and Families (DCF), Centers for Disease Control and Prevention (CDC), Florida's Bureau of Vital Statistics, Florida Department of Juvenile Justice and Florida Department of Education. Quantitative data tables and figures in this report are formatted to facilitate review, examination, and use by the community. In many cases, the data, as it was gathered from the source, contained confidence intervals or margins of error, which are statistical calculations that refer to the potential variation in the numbers shown when the data is gathered from a subset of the population. These details have been omitted from this assessment in an effort to make the data more palatable to the community. Additionally, some sources are only available for certain years based on data collection timelines therefore, results from those sources may be presented in varying years or multi-year estimates. Where available, five-year estimates from the US. Census Bureau were used to capture the most complete data for the report. In addition, the most recent full-year data sets were used for indicators throughout the report. Data is presented throughout the report in as much detail as possible, including data disaggregated by race, ethnicity, sex, age, or Census County Division (CCD).

The qualitative data are a result of primary data collection efforts through local public health system assessments, focus groups and key informant interviews. Data was collected, analyzed, and compiled for this assessment to enable and guide Palm Beach County service providers, educators, planners, funders and community leaders in identifying indicators within the community that should be addressed to improve the health and wellbeing of Palm Beach County residents.

## Demographic and Socioeconomic Profile

Palm Beach County is the largest county, geographically, in Florida covering about 2,383 square miles of land and water in the southeast region of the state. The county is comprised of 39 municipalities. The northernmost community is Tequesta, the southernmost is Boca Raton, and the westernmost is South Bay. West Palm Beach is the largest city in Palm Beach County and is also the county seat. ${ }^{1}$ Bordering Palm Beach County is Martin County to the north, the Atlantic Ocean to the east, Broward County to the south, Hendry County to the west, and Lake Okeechobee in the northwest.

In 2019, Palm Beach County had a total population of $1,465,027$ residents, which accounted for approximately $7 \%$ of the state's population. The county's population is continuing to grow. Compared to the state, Palm Beach County is home to a relatively large senior population with nearly one-fourth of the residents comprised of those 65 years and over. This number is higher than Florida ( $20.1 \%$ ) and the United States (16.5\%). A quarter of the county's residents were born outside of the United States, a number that is higher than the state of Florida ( $20 \%$ ) and nearly double the national percentage ( $13.5 \%$ ). Black or African American residents comprise $18.7 \%$ of the population while Hispanic/Latino residents make up $22.4 \%$ of the population. ${ }^{2}$

Demographics include factors such as race and ethnicity, age, English language proficiency, household type, population density, etc., all of which influence health outcomes. ${ }^{3}$ The aim of the demographic and socioeconomic profile in this report is to provide context for the remaining sections by providing an overview of the demographic and socioeconomic characteristics of the residents of Palm Beach County. These characteristics provide context for the health care needs of the community and are indicators and predictors for health care utilization patterns and health outcomes. Furthermore, the demographic and socioeconomic profile of a community provides information important in the identification of barriers to accessing health care services.

The data included in this report is specific to Palm Beach County and in many cases, for comparison purposes, data is presented for the state of Florida as well as surrounding counties. Throughout the report, certain sections will include references to the Healthy People 2030 target goals. The targets are included to provide a benchmark and potentially aid in future health planning and goal-setting activities.

## Demographic Characteristics

## Population

## Total Population

The table below shows Palm Beach County's population count compared to the state of Florida's, as well as the proportion of Florida's population that is made up of Palm Beach County residents, as of 2019. According to the U.S. Census Bureau, Palm Beach County's population grew to $1,465,027$ residents in 2019. The county made up approximately $7.0 \%$ of Florida's total population of 20,901,636 residents in 2019.

Table 2:Total Population, Palm Beach County and Florida, 5-Year Estimate, 2019

## Population by Census County Division

A Census County Division (CCD) is an established area set by the U.S. Census Bureau and state and local governments. CCDs are an important way to analyze and depict data by smaller sub-sections of the county.

In Palm Beach County, there are eleven established CCDs, including Belle Glade-Pahokee, Boca Raton, Boynton Beach-Delray Beach, Glades, Jupiter, Lake Worth, Riviera Beach, Royal Palm Beach-West Jupiter, Sunshine Parkway, Western Community, and West Palm Beach. The table below shows the population by CCD in Palm Beach County in 2019. Among these areas, the Boynton Beach-Delray Beach CCD was the most populous in 2019 with $23.0 \%$ of the county's population, followed by the Lake Worth CCD (15.8\%) and Sunshine Parkway CCD (14.5\%). The least populous CCD was the Glades CCD, with 309 residents counted in 2019.

Table 3: Population by Census County Division, Palm Beach County, 5-Year Estimate, 2019

| Census Count Division (CCD) | Count | Percent |
| :--- | ---: | ---: |
| Total Population | $1,465,027$ | $100.0 \%$ |
| Belle-Glade-Pahokee CCD | 37,326 | $2.5 \%$ |
| Boca Raton CCD | 138,198 | $9.4 \%$ |
| Boynton Beach-Delray Beach CCD | 336,806 | $23.0 \%$ |
| Glades CCD | 309 | $0.0 \%$ |
| Jupiter CCD | 95,352 | $6.5 \%$ |
| Lake Worth CCD | 231,897 | $15.8 \%$ |
| Riviera Beach CCD | 109,559 | $7.5 \%$ |
| Royal Palm Beach-West Jupiter CCD | 110,537 | $7.5 \%$ |
| Sunshine Parkway CCD | 213,091 | $14.5 \%$ |
| Western Community CCD | 30,844 | $2.1 \%$ |
| West Palm Beach CCD | 161,108 | $11.0 \%$ |

## Population Growth and Change

Population growth is a key factor used to determine the composition and need of a community. As populations grow and age, needs will evolve and services will expand.

The table below depicts the population change by age group between 2018 and 2019 in Palm Beach County. The population of Palm Beach County grew by $1.3 \%$ from 1,446,277 in 2018 to 1,465,027 in 2019. The largest population increase was reported among those ages 60 to 64 years old, with a $3.7 \%$ increase from 2018 to 2019. Those ages 20 to 24 years old saw the largest population decrease ( $0.9 \%$ ) during this timeframe. The median age for Palm Beach County increased from 44.6 years old to 44.8 years old from 2018 to 2019.

Table 4: Population Change by Age Group, Palm Beach County, 5-Year Estimate, 2018-2019

| Age Group | 2018 Population | 2019 Population | Percent Change 2018-2019 |
| :--- | ---: | ---: | ---: |
| Total population | $1,446,277$ | $1,465,027$ | $1.3 \%$ |

## Population by Sex

Previous research indicates that sex at birth can have a significant influence on health outcomes. Males and females may show different disease related symptoms and experience different disease risks. Additionally, different sexes may be more or less susceptible to certain diseases. For example, about $80 \%$ of those affected by autoimmune diseases are female, but autoimmune conditions in males are typically more severe. ${ }^{4}$

The following table shows the total population by sex in Palm Beach County and Florida in 2019. Among Palm Beach County residents, $48.5 \%$ were male and $51.5 \%$ were female in 2019 . The state had a similar trend overall, with $48.9 \%$ of the population being male and $51.1 \%$ being female this same year. The below chart depicts male and female counts within Palm Beach County and the state of Florida in 2019.

Table 5: Total Population by Sex, Palm Beach County and Florida, 5-Year Estimate, 2019

[^2]
## Population by Age

According to the World Health Organization, the pace of population aging is increasing at a much faster pace than ever seen before. By 2030, one out of every six people will be age 60 years or older. ${ }^{5}$ The following table depicts the Palm Beach County and Florida residential population by age in 2019. Among Palm Beach County residents,19.2\% were under the age of 18 years old in 2019. Those who were 18 years old and over made up $80.5 \%$ of the population. This population proportion is similar to that of the state as a whole, where $20.0 \%$ of the population was under 18 years old and $80.0 \%$ was 18 years old and older in 2019. Additionally, $27.3 \%$ of Palm Beach County residents were over 62 years of age compared to $23.9 \%$ of all Florida residents.

Table 6: Population by Age, Palm Beach County and Florida, 5-Year Estimate, 2019

## Population by Census County Division, By Sex and Age, Western Palm Beach County CCDs

Further breakdown of the population by Census County Division (CCD) can provide insight into the specific makeup of certain regions of the county.

The table below depicts population by CCD by sex and age in Western Palm Beach County CCDs in 2019. For this report, the Western Palm Beach County CCDs include Belle Glade-Pahokee CCD, Glades CCD, and Western Community CCD. Among these areas, the Western Community CCD had the highest median age (43.2 years) compared to the other CCDs. Among each of the CCDs in this region, there is a larger percentage of males compared to females.

## Population by Census County Division, By Sex and Age, Northern Palm Beach County CCDs

The following table shows the population by CCD by sex and age in Northern Palm Beach County CCDs in 2019. Northern Palm Beach County CCDs include Jupiter CCD, Riviera Beach CCD, Royal Palm Beach-West Jupiter CCD, and West Palm Beach CCD. Among these areas, Jupiter CCD had the highest median age (47 years). Among each of the CCDs in the Northern Palm Beach County CCD grouping, a majority of residents were female.

## Population by Census County Division, By Sex and Age, Southern Palm Beach County CCDs

Lastly, this table shows the population by CCD by sex and age in Southern Palm Beach County CCDs in 2019. the Southern Palm Beach County CCD's noted in this report include Boca Raton CCD, Boynton Beach-Delray Beach CCD, Lake Worth CCD, and Sunshine Parkway CCD. The eldest median age for these areas was found in Boca Raton ( 51.8 years), which was also the highest median age among all CCD's in Palm Beach County. A majority of residents in this region were female.

## Population by Race and Ethnicity

The table and graphs below show the population by race and ethnicity in Palm Beach County and Florida in 2019. According to the 2019 American Community Survey conducted by the U.S. Census Bureau, a majority of Palm Beach County residents were White in 2019. Approximately 73.5\% of Palm Beach County residents were White, while $18.7 \%$ were Black or African American. The state of Florida reflected a similar trend, with $75.1 \%$ of residents identifying as White and $16.1 \%$ of residents identifying as Black or African American.

Additionally, $77.6 \%$ of Palm Beach County residents were non-Hispanic, while $22.4 \%$ were Hispanic or Latino. Across the state of Florida, $74.4 \%$ of residents were non-Hispanic, while $15.6 \%$ were Hispanic or Latino. This is significant because research indicates that health disparities exist among certain racial and ethnic groups, leading to poorer health outcomes, disproportionate access to care, and overall inequities related to diagnoses and treatment of health conditions. For instance, certain racial and ethnic communities suffer from higher rates of chronic disease and premature death compared to their White counterparts. ${ }^{6}$

## Population by Census County Division, By Race and Ethnicity, Western Palm Beach County CCDs

Further population analysis can be conducted by Census County Division (CCD). This table shows the population by CCD by race and ethnicity in the Western Palm Beach County CCDs in 2019. Among these CCDs, the Glades CCD reported the highest percentage of Hispanic or Latino residents in 2019 at nearly half the population (48.9\%). This was also the highest percentage of Hispanic or Latino residents across all Palm Beach County CCDs. The Belle Glade-Pahokee CCD population was 58.6\% Black or African American and 36.0\% White, compared to 26.9\% Black or African American and $73.1 \%$ White in the Glades CCD. Additionally, $12.8 \%$ of the Western Community CCD reported being Black or African American, whereas 78.6\% reported being White.

## Grandparents

## Grandparents Living with Their Own Grandchildren

Research shows that grandparents who raise their grandchildren experience positive impacts, including the satisfaction associated with providing for and raising a child. However, grandparents raising their grandchildren may also report challenges, including isolation from peers, physical and emotional challenges associated with raising a child, and perceived stigma. ${ }^{7}$

The table below shows the number and percentage of grandparents living with and responsible for grandchildren under 18 years of age based on the length of time responsible for their grandchildren in Palm Beach County and Florida in 2019. In Palm Beach County, 28\% of grandparents living with their grandchildren under 18 years of age were responsible for their grandchildren. Nearly half ( $49.3 \%$ ) of these grandparents had been responsible for their grandchildren under 18 years of age for 5 years or longer. A similar trend was seen across the state of Florida, where $29.6 \%$ of grandparents living with their own grandchildren under the age of 18 years were responsible for their grandchildren.

Table 17: Grandparents Living with Own Grandchildren Under 18 Years by Responsibility for Own Grandchildren by Length of Time Responsible for Own Grandchildren for The Population 30 Years and Over, Palm Beach County and Florida, 5-Year Estimate, 2019

|  | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Percent | Count | Percent |
| Number of Grandparents living with own <br> grandchildren under 18 years | 32,419 | $100 \%$ | 497,503 | $100 \%$ |
| Grandparent responsible for own grandchildren <br> under 18 years | 9,093 | $28.0 \%$ | 147,177 | $29.6 \%$ |
| Grandparent responsible less than 6 months | 1,167 | $12.8 \%$ | 14,643 | $9.9 \%$ |
| Grandparent responsible 6 to 11 months | 765 | $8.4 \%$ | 13,659 | $9.3 \%$ |

## Population with a Disability

## Population Living with a Disability

Living with a disability can present additional medical and socioeconomic complications for residents. Research has shown that adults with disabilities are four times more likely to report their health as fair or poor compared to people with no disabilities. ${ }^{8}$

The following table shows the percentage of the total population living with a disability in Palm Beach County by CCD and Florida in 2019. In the state of Florida, 13.4\% of the population was living with a disability in 2019. Comparatively, the rate was lower in Palm Beach County, with $12.3 \%$ of the population living with a disability at the time. Among Palm Beach County CCDs, the rate was highest in the Boynton Beach-Delray Beach CCD (14.9\%), Belle Glade-Pahokee CCD (13.7\%), West Palm Beach CCD (12.3\%), Riviera Beach CCD (12.2\%), and Lake Worth CCD (12.1\%).

Table 18:Population Living with a Disability, Palm Beach County CCD's and Florida, 5-Year Estimate, 2019

| Geographic Area | Population with a <br> Disability | Percent of Total <br> Population |
| :--- | ---: | ---: |
| Florida | $2,768,155$ | $13.4 \%$ |
| Palm Beach County, Florida | 178,306 | $12.3 \%$ |
| Belle Glade-Pahokee CCD | 4,427 | $13.7 \%$ |
| Boca Raton CCD | 15,655 | $11.4 \%$ |

## Population with a Disability, By Sex, Age, Race, and Ethnicity

In addition to the health and socioeconomic disparities that people with disabilities experience, disparities based on sex, age, race, and ethnicity can further exacerbate issues. Certain racial and ethnic populations experience health disparities at an increased rate compared to their White, non-Hispanic counterparts. ${ }^{9}$ Understanding the intersection of these factors among those with disabilities can help programs and policymakers better address the complex issues at hand for these populations.

The table below shows the population with a disability by sex, age, race, and ethnicity in Palm Beach County and Florida in 2019. Among Palm Beach County residents, the percentage of males and females living with a disability was very similar in 2019 , with $12.0 \%$ of males and $12.6 \%$ of females living with a disability. The percentage of the population living with a disability was exponentially higher among those ages 75 years and older ( $42.5 \%$ ) compared to all other age groups and lowest among those ages five years or younger ( $0.4 \%$ ). Native Hawaiian and other Pacific Island residents had the highest percentage of their population living with a disability ( $28.8 \%$ of the population). Among the Hispanic or Latino population, $8.3 \%$ of this population reported living with a disability in 2019, as compared to $15.2 \%$ of the non-Hispanic resident population.

## Population Living with a Disability, By Race and Ethnicity, Western Palm Beach County CCDs

The table below depicts the racial and ethnic characteristics of those living with a disability in the Western Palm Beach County Census County Divisions (CCDs) in 2019. It is important to note that $15.6 \%$ of Black or African American residents in the Belle Glade-Pahokee CCD had a disability in 2019. This was the largest percentage of any racial population with a disability in the Western Palm Beach County CCD grouping.

## Population Living with a Disability, By Race and Ethnicity, Northern Palm Beach County CCDs

This table shows the racial and ethnic characteristics of those living with a disability in the Northern Palm Beach County Census County Divisions (CCDs) in 2019. In this CCD grouping, the Jupiter CCD had the highest percentage of Black or African American residents with a disability (12.4\%). The Royal Palm Beach-West Jupiter CCD had the highest percentage of Hispanic or Latino residents with a disability (9.7\%) in 2019.

## Population Living with a Disability, By Race and Ethnicity, Southern Palm Beach County CCDs

The following table shows the racial and ethnic characteristics of those living with a disability in the Southern Palm Beach County CCDs in 2019. In this CCD grouping, 17.1\% of the Boynton Beach-Delray Beach CCD White population had a disability in 2019. The Boynton Beach-Delray Beach CCD had the highest percentage of Hispanic or Latino residents living with a disability ( $9.1 \%$ ), closely followed by the Lake Worth CCD (9.0\%)

## Population with a Disability by Age and Type

People who live with a disability are more likely to face health care disparities compared to those without a disability due to social and environmental challenges relating to the social determinants of health. For example, these challenges can result in lower screening rates and increased challenges when accessing care. Those with disabilities may also experience lower educational attainment, lower incomes, and higher unemployment. Additionally, research shows that people with disabilities are more likely to use tobacco, forgo physical activity, and be obese or overweight. ${ }^{10}$ Such behaviors and social and environmental challenges can lead to poorer health outcomes for those with disabilities, so it is important to understand the characteristics of the Palm Beach County residents who have a disability.

The table below depicts the population with a disability in Palm Beach County compared to that of Florida by resident age and type of disability in 2019. Among all age groups, those ages 65 years and older were most likely to have a disability in Palm Beach County. Among this specific population, the disability categories most frequently reported were ambulatory difficulty (19.3\%) and hearing difficulty (12.6\%).

[^12]2022 Palm Beach County, Florida Community Health Assessment

## Socioeconomic Characteristics

## Poverty

Those who live in poverty face increased socioeconomic challenges that can affect healthcare access and utilization. Without proper resources and assistance programs, those in poverty may forgo medical appointments or necessary medications due to cost barriers. Neglecting needed health services and delaying care can then exacerbate financial and medical complications in the future.

It is important to note that the poverty-related data displayed below include pre-pandemic figures. The COVID-19 pandemic and resulting unemployment rates increased poverty rates throughout the country, with those who were already living in poverty being the hardest hit and having the hardest time recovering from the pandemic recession. ${ }^{11}$ As such, once more recent data becomes available the actual impact of the pandemic on the prevalence of poverty in Palm Beach County can be assessed.

## Poverty Guidelines

The table below shows the official poverty guidelines for the state of Florida, updated in 2019 to reflect the most recent income thresholds based on household size. For a family of four living in Florida in 2019, the poverty guideline was $\$ 32,187.50$ ( $125 \%$ of the Federal Poverty Level). It is important to note that the 2019 Federal Poverty Guidelines were used in this report because the most recent Census data related to demographics and socioeconomic status is from 2019. This allows for accurate and mindful comparisons to be made across the data in the report.

Table 24: Poverty Guidelines, Florida, 2019

## Poverty Status in the Past 12 Months, By Age and Sex

The table below depicts the poverty status by age and sex in Palm Beach County and Florida in 2019. Nationally, poverty rates among women remain higher than their male counterparts. ${ }^{12}$ In Palm Beach County, more females $(13.2 \%)$ were living below the poverty level than males ( $11.1 \%$ ). Similar trends were seen in the state of Florida as a whole, as depicted in the table below. Of all Palm Beach County residents, $12.2 \%$ of residents were living below the poverty level in 2019. Among county residents under 18 years of age, $18.1 \%$ were living below the poverty line, which was the highest percentage of individuals living below the poverty line among all age groups. Among residents 18 years of age or older, those 18 to 64 years old (11.4\%) had the second highest percentage of individuals living below the poverty level, followed by residents ages 65 years and older ( $9.2 \%$ ).

The Healthy People 2030 national target is to reduce the proportion of people living in poverty to $8.0 \% .{ }^{13}$ As of 2019, Palm Beach County with $12.2 \%$ of the population living in poverty is not yet meeting this target.

## Poverty Status by Census County Division (CCD), By Age and Sex, Western Palm Beach County CCDs

Further breakdown of poverty status by age and sex can provide insight into health and socioeconomic status by county region. This table shows the poverty status by CCD by age and sex for the Western Palm Beach County CCDs in 2019. In this area, the Belle Glade-Pahokee CCD had the greatest percentage of residents living below the poverty level ( $41.0 \%$ ), followed by the Glades CCD ( $37.9 \%$ ). Across all CCDs, females were more likely than males to be below the poverty line (note that Glades CCD did not have data broken down by sex). In the Belle GladePahokee CCD, which had the highest percentage of residents below the poverty level, those under the age of 18 were the most affected by poverty. Over half ( $53.6 \%$ ) of residents under the age of 18 in this area were living below the poverty level.

## Poverty Status by Census County Division (CCD), By Age and Sex, Southern Palm Beach County CCDs

Lastly, the table below shows the poverty status by CCD by age and sex for the Southern Palm Beach County CCDs in 2019. Among these CCDs, Lake Worth CCD had the greatest percentage of residents living below the poverty level (16.6\%) in 2019. Approximately one-quarter of Lake Worth CCD's population under the age of 18 years lived in poverty. Overall, females in each Southern Palm Beach County CCD experienced poverty in higher percentages compared to their male counterparts.

## Poverty Status in the Past 12 Months, By Race and Ethnicity

Poverty status is associated with a decreased ability to access care and services in a timely, quality manner. ${ }^{14}$ It is thus imperative to consider the population's racial and ethnic composition when developing and targeting programming intended to improve the health of the community. According to the CDC, racial and ethnic minorities have been disproportionately impacted by the COVID-19 pandemic, including reported heightened cases, hospitalizations, and deaths among these groups. In the time following the disease's rapid spread, it is likely that communities of racial and ethnic minorities will see a further disproportionate impact in socioeconomic status as a result of the pandemic, including additional impacts on poverty status. ${ }^{15}$

This table and graphs below show the poverty status of Palm Beach County and Florida residents by race and ethnicity in 2019. During this year, the Census reported that Black residents made up $13.2 \%$ of the United States population but accounted for $23.8 \%$ of the population living in poverty. A greater percentage of Palm Beach County Black or African American residents (19.4\%) were living in poverty in 2019 compared to White residents (10.1\%). When examining ethnicity, Hispanic residents made up 18.7\% of the total United States population in 2019 but accounted for $28.1 \%$ of the population living in poverty. Notably, $17.6 \%$ of Hispanic or Latino residents were living in poverty compared to their White, non-Hispanic counterparts (7.7\%).

## Poverty Status in the Past 12 Months, By Families

Families in poverty may have unique needs compared to other groups. In families with children living in poverty, stigma and stressors resulting from poverty status can affect both parents and children individually, as well as the overall family dynamic. Families in poverty often experience issues with transportation, access to needed services due to financial barriers, unsafe or inadequate living conditions, and more. ${ }^{16}$

The chart below details poverty status of families and families with children under the age of 18 years old in Palm Beach County and Florida in 2019. Approximately $8.4 \%$ of families in Palm Beach County had experienced poverty in the last 12 months. Among those, $14.1 \%$ had children under the age of 18 years old.

[^17]
## Poverty Status in the Past 12 Months, Families, By Race and Ethnicity

Racial and ethnic minoritized populations experience poverty at higher proportions compared to their White, nonHispanic counterparts. The table below outlines family poverty status by race and ethnicity in Palm Beach County and Florida in 2019. Overall, $8.4 \%$ of Palm Beach County families were living below the poverty level. This rate was highest among Black or African American families (15.9\%) compared to all other races. The state of Florida reported a higher rate of families living in poverty than the county, with $10.0 \%$ of families overall living below the poverty level. Additionally, $18.1 \%$ of Black or African American families lived below the poverty level, the highest proportion of all races. It is important to note that $14.1 \%$ of Palm Beach County families who lived in poverty in 2019 had children under the age of 18 living in the home compared to the state rate of $16.3 \%$. As previously mentioned, the data below include pre-pandemic figures. The pandemic has worsened long-standing disparities for many families, but especially for people of color, young adults, women, parents of young children, and low-income workers. ${ }^{17}$

## Poverty Status by Census County Division (CCD), By Race and Ethnicity, Western Palm Beach County CCDs

Poverty status can also be examined by Census County Division (CCD) to provide insight based on region of the county. The following table shows the poverty status by CCD by race and ethnicity in the Western Palm Beach County CCD in 2019. The Belle Glade-Pahokee CCD reported the highest percentage of residents living below the poverty level ( $41.0 \%$ ) compared to the other Western Palm Beach County CCDs. In the Belle Glade-Pahokee CCD and the Western Community CCD, a greater percentage of Hispanic or Latino residents were living below the poverty level than their non-Hispanic counterparts.

## Poverty Status in the Past 12 Months of Grandparents Living with Own Grandchildren Under 18 Years by Responsibility for Own Grandchildren, By Families

Grandparents raising grandchildren can create a unique family structure that comes with complex needs. Research has shown that grandparents who are responsible for raising their grandchildren are more vulnerable to negative health outcomes, social isolation, and depression. These families may also face added legal, financial, school-based, parenting, and relationship issues. ${ }^{18}$ For these reasons, it is important to consider grandparents raising grandchildren when assessing the health of a community.

The table below shows the poverty status of grandparents living with their grandchildren under 18 years of age in Palm Beach County and Florida in 2019. Among Palm Beach County grandparents living with their own grandchildren, $14.7 \%$ reported an income below the poverty level and $85.3 \%$ reported an income above the poverty level. This was comparable to the respective state rates, where $14 \%$ of grandparents reported an income below the poverty level and 86.0\% reported an income above the poverty level in 2019.

## Poverty Status in the Past 12 Months of Grandparents Living with Own Grandchildren Under 18 Years by Responsibility for Own Grandchildren, By Families, Western Palm Beach County CCDs

Poverty status among grandparents caring for their own grandchildren can be further analyzed by Census County Division (CCD) to provide insight into regional trends and needs.

This table shows the poverty status of grandparents living with their own grandchildren under 18 years of age in the Western Palm Beach County CCDs in 2019. In this area, 44.9\% of Belle Glade-Pahokee grandparents living with their grandchildren lived below the poverty level. This was the highest percentage among all Western CCDs. Of those, $25.7 \%$ were responsible for their grandchildren under the age of eighteen years old.

## ALICE

## ALICE Population

Asset Limited, Income Constrained, Employed, or ALICE, households are households where residents are earning more than the Federal Poverty Level but less than the basic cost of living for the area. This is also known as the ALICE threshold. Individuals and families who fall into the ALICE threshold are living paycheck to paycheck and struggle to afford necessities, despite employment. In the event of a crisis, these households are at risk of poverty.

The table below shows the percentage of ALICE households compared to the percentage of households in poverty in Palm Beach County and Florida in 2018. In Florida, the median household income in 2018 was $\$ 55,462$ compared to $\$ 61,691$ in Palm Beach County. Approximately 34\% of households in Palm Beach County fit the ALICE definition compared to $33 \%$ at the state level. This is significant because only $12 \%$ of Palm Beach County households were living in poverty in 2018, underscoring the additional number of households in the county that are not included in this number but are nonetheless struggling to make enough money to meet basic needs.

Table 39: ALICE Population, Palm Beach County and Florida, 2018

|  | Total Households | \% ALICE Households | \% Households in Poverty |
| :--- | ---: | ---: | ---: |
| Palm Beach County | 552,286 | $34.0 \%$ | $12.0 \%$ |
| Florida | -- | $33.0 \%$ | $13.0 \%$ |

## ALICE Population, Palm Beach County CCDs

This table depicts the percentage of households falling in the ALICE threshold in each Palm Beach County CCD in 2018. This information can help providers understand the population's needs in their region of the county. The Belle Glade-Pahokee CCD (83.0\%) and Glades CCD (83.0\%) had the highest percentage of households falling in the ALICE threshold compared to the rest of the Palm Beach County CCDs. Alternatively, Western Community CCD (29.0\%) had the lowest proportion of households falling in the ALICE threshold.

Table 40: ALICE Population, Palm Beach County CCDs, 2018

| Census County Division (CCD) | Total Households | \% ALICE Households |
| :--- | ---: | ---: |
| Belle Glade-Pahokee CCD | 10,380 | $83.0 \%$ |
| Boca Raton CCD | 60,167 | $38.0 \%$ |
| Boynton Beach-Delray Beach CCD | 137,788 | $50.0 \%$ |
| Glades CCD | 251 | $83.0 \%$ |
| Jupiter CCD | 38,613 | $36.0 \%$ |
| Lake Worth CCD | 77,035 | $61.0 \%$ |
| Riviera Beach CCD | 42,747 | $48.0 \%$ |
| Royal Palm Beach-West Jupiter CCD | 38,603 | $36.0 \%$ |
| Sunshine Parkway CCD | 73,249 | $36.0 \%$ |
| West Palm Beach CCD | 59,843 | $61.0 \%$ |
| Western Community CCD | 9,540 | $29.0 \%$ |

## Income

Income is widely recognized as a social determinant of health. Those with a higher income are generally able to afford health insurance, obtain timely and quality healthcare services, and take part in routine medical check-ups and adhere to medication regimens. As a result, these individuals tend to have improved health outcomes compared to residents who do not have a stable income. On the other hand, a lack of adequate, stable income can significantly influence health-seeking behaviors and health care utilization. In essence, residents may be forced to make difficult choices about which healthcare services they can afford. Low-income residents also experience other barriers to obtaining adequate and timely care, such as transportation barriers, time barriers, and insurance-related barriers. Additionally, as income inequality is a growing problem across the country, the result is in increase in health disparities among certain populations. ${ }^{19}$

According to the U. S. Department of Health and Human Services, low-income workers have been disproportionately impacted by the economic impact of the COVID-19 pandemic. As a result of the pandemic, low-income families have experienced decreased access to childcare and increased stress, social isolation, and risk of child maltreatment and intimate partner violence. ${ }^{20}$ For these reasons, it is critical to consider income factors when analyzing the population in Palm Beach County and the health outcomes of residents. It is important to note that the data below include prepandemic figures, thus, once more recent data becomes available, the actual impact of the pandemic on income and earnings in Palm Beach County can be assessed.

## Per Capita Income and Earnings

As previously mentioned, income can determine an individual's access to health care services. Per capita income measures the amount of income earned per person in a region. The following table shows the per capita income and earnings in Palm Beach County and Florida in 2019. Palm Beach County recorded a higher per capita income ( $\$ 39,933$ ), median earnings for workers overall ( $\$ 32,308$ ), median earnings for male full-time, year-round workers $(\$ 49,093)$, and median earnings for female full-time, year-round workers (\$41.982) than the state of Florida in 2019.

Table 41: Per Capita Income and Earnings, Palm Beach County and Florida, 5-Year Estimate, 2019

|  | Palm Beach County | Florida |
| :--- | ---: | ---: |
| Per capita income | $\$ 39,933$ | $\$ 31,619$ |
| Median earnings for workers | $\$ 32,308$ | $\$ 31,243$ |
| Median earnings for male full-time, year-round workers | $\$ 49,093$ | $\$ 44,724$ |
| Median earnings for female full-time, year-round workers | $\$ 41,982$ | $\$ 38,333$ |

[^22]
## Household Income and Benefits

Household income is a socioeconomic indicator for healthcare access and affordability. The table below shows the household income and benefits for Palm Beach County and Florida households in 2019. The percentage of households with earnings in Palm Beach County ( $70.5 \%$ ) was slightly lower than the percentage of Florida households with earnings ( $72.4 \%$ ). The median household income in Palm Beach County was significantly higher than the state average, at $\$ 99,173$ and $\$ 80,343$, respectively. The percentage of households that received income from Social Security was higher among Palm Beach County residents (40.4\%) compared to state residents (37.4\%) as a whole. However, the percentage of households that received income from other benefits, such as retirement (20.2\%), Supplemental Security (3.7\%), and Food Stamp/SNAP (9.8\%) benefits was lower for Palm Beach County residents compared to Florida residents overall. The percentage of households with cash public assistance was the same for both Palm Beach County and Florida (2.1\%). As previously mentioned, the data below include prepandemic figures, so the impact of the pandemic can be assessed once more recent data becomes available.

Table 42: Household Income and Benefits, Palm Beach County and Florida, 5-Year Estimate, 2019

[^23]Compiled by: Health Council of Southeast Florida, 2021

## Family Income

Family income is another indicator of socioeconomic status and can help programs and providers understand the community in which they serve. Both income and income inequality are proven to have an effect on health outcomes,.

The following table and graph depict family income in Palm Beach County and Florida in 2019. Median family income was higher in Palm Beach County ( $\$ 78,370$ ) compared to the state of Florida ( $\$ 67,414$ ). Most families in Florida (19.2\%) reported a family income of $\$ 50,000$ to $\$ 74,999$, while most families in Palm Beach County (17.5\%) reported an income of $\$ 100,000$ to $\$ 149,000$. As previously mentioned, the data below include pre-pandemic figures. The pandemic led to devastating economic effects, particularly among low-income families. ${ }^{21}$ As such, once more recent data becomes available the actual impact of the pandemic on family income in Palm Beach County can be assessed.

Table 43: Family Income, Palm Beach County and Florida, 5-Year Estimate, 2019

|  | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |

[^24]
## GINI Index

The GINI Index is a measurement of income distribution throughout the county. Based on the residents' net income, the value will vary between 0 and 1. A value of 0 indicates perfect equality, where there is a proportional distribution of income among the residents. A value of 1 indicates perfect inequality, where one household possesses all of the income and other households do not have an income. The Gini Index helps identify high levels of income inequality, which may ultimately lead to slower gross domestic product growth, a reduction in economic mobility, increased individual debt, and an increase in poverty rates. Importantly, the Gini Index provided below is based on 20195 -year estimates, so it is likely that the figures have changed as a result of the economic impacts of the pandemic.

The table below depicts the GINI Index in Palm Beach County, surrounding counties, and the state of Florida in 2019. Palm Beach County reported a GINI Index of 0.5219 , which was higher than that of the state of Florida ( 0.4862 ) but comparable with the surrounding area counties. This indicates that the state of Florida's income distribution is slightly more equitable than that of Palm Beach County.

Table 44: GINI Index, Palm Beach County, Florida, and Surrounding Counties, 5-Year Estimate, 2019

| Area | GINI Index |  |
| :--- | ---: | ---: |
| Florida |  | 0.4862 |
| Palm Beach County |  | 0.5219 |
|  |  | 0.4884 |
| Surrounding Counties: |  | 0.5257 |

## Homelessness

Homelessness is associated with increased rates of morbidity. Homeless populations often experience poorer health outcomes due to a lack of routine medical care, neglected chronic conditions, and direct complications as a result of being unsheltered. The Centers for Disease Control and Prevention estimated that while approximately $18 \%$ of U.S. adults visited the emergency room over the course of one year (2014), that number more than tripled among individuals who did not have stable housing (over $60 \%$ ). Lack of insurance and limited access to routine care are factors that contribute to increased emergency department visits. These emergency department encounters can be much more severe and costly than routine medical care, creating a cycle of medical uncertainty and complications for individuals. ${ }^{22}$ Furthermore, the COVID-19 pandemic's emergence in 2020 will likely have an effect on the data presented in this section in the future. According to research, the disproportionate rates of underlying health conditions, stigma and marginalization that often disenfranchise these groups from health and social services, and the living conditions experienced by the homeless population potentiate the risk of COVID-19 transmission and adverse outcomes, further impacting this group of the population. ${ }^{23}$ For these reasons, it is imperative to consider the homeless population in Palm Beach County when working to understand the community's health and the future impacts of intervention and prevention programs in the county.

## Homeless Count by Continuum of Care

The chart below depicts homeless counts in Palm Beach County and Florida from 2017 to 2021. It is important to note that the 2020 Point in Time Count numbers are not comparable to the previous years' counts due to COVID-19 safety concerns that affected the annual count of unsheltered homeless individuals. From 2019 to 2020, Palm Beach County saw a rise in homelessness from $6.3 \%$ to $7.5 \%$. In this same time period, the state overall was experiencing a decrease in homelessness from $-3.9 \%$ in 2019 to $-4.0 \%$ in 2020 . At that point, only sheltered individuals were counted in both Palm Beach County and largely across the state, which was not in line with the previous years' counts, which undoubtedly resulted in the missed count of many homeless individuals who did not reside in a shelter.

Table 45: Homeless Count by Continuum of Care, Palm Beach County and Florida, 2017-2021

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Percent Change | Count |
| 2017 | 1,607 | -- | 32,109 | -- |
| 2018 | 1,309 | $-22.8 \%$ | 29,717 | $-8.0 \%$ |
| 2019 | 1,397 | $6.3 \%$ | 28,591 | $-3.9 \%$ |
| 2020 | 1,510 | $7.5 \%$ | 27,487 | $-4.0 \%$ |
| $2021^{* *}$ | 458 | $-229.7 \%$ | 21,218 | $-29.5 \%$ |

Note: **The 2021 Point in Time Count numbers are not comparable to the previous years' counts. Typically, Continuums of Care (CoCs) conduct a PIT Count of both sheltered and unsheltered households. This year, due to COVID-19 related safety concerns, only six of the 27 CoCs conducted such a count; 10 CoCs did not conduct an unsheltered count; and others conducted a modified form of the unsheltered count. All CoCs conducted a sheltered PIT count. For those that did not conduct an unsheltered count, the CoCs reported zero unsheltered persons, resulting in an undercount of homelessness.

## Homeless Students by District

Homeless students face barriers and stressors outside of the school system that may impact their attendance, learning, and school performance. In Palm Beach County, there was a notable steady increase of homeless students from 3,750 in the 2014-2015 school year to 4,500 in the 2019-2020 school year. The number of homeless students in Florida fluctuated over the same time period, with a 14.9\% decrease from 91,863 in the 2018-2019 school year to 79,949 in the 2019-2020 school year.

Table 46: Homeless Students by District, Palm Beach County and Florida, School Years 2014-2015 Through 20192020

| School Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Percent Change | Count | Percent Change |
| $2014-2015$ | 3,750 | -- | 73,417 | -- |
| $2015-2016$ | 3,759 | $0.2 \%$ | 72,957 | $-0.6 \%$ |
| $2016-2017$ | 4,311 | $12.8 \%$ | 76,211 | $4.3 \%$ |
| $2017-2018$ | 4,410 | $2.2 \%$ | 96,028 | $20.6 \%$ |
| $2018-2019$ | 4,473 | $1.4 \%$ | 91,863 | $-4.5 \%$ |
| $2019-2020$ | 4,500 | $0.6 \%$ | 79,949 | $-14.9 \%$ |

[^26]
## Education

Education is vital to the growth and development of residents, and it is well known that there is a positive relationship between education and health. ${ }^{24}$ Beginning in 2020, the education system faced many challenges as the spread of the COVID-19 pandemic led many school districts to pause in-person learning and shift to virtual learning conducted online outside of the traditional school setting. Data presented in this section may be impacted in the future due to this shift in virtual learning, childhood stress experienced during the pandemic, and revised practices for testing as a result of the pandemic.

## School Enrollment

The experiences that children have in learning programs influence their development and growth. ${ }^{25}$ Educational programs and early learning programs are critical to childhood social and emotional development, serving as a catalyst for children to develop skills, relationships, and interests that shape their future. Studies have shown that early learning programs lead to enhanced literacy, language, math, and self-regulation skills. For children who are dual language learners or are from lower income households, positive results were greater when early learning programs were attended. ${ }^{26}$ School enrollment is also an indication of population growth and can inform service delivery planning, as schools are often an avenue for health education and service delivery. Thus, understanding school enrollment is useful as agencies plan and implement programs.

The table below shows the count and percent of school enrollment in Palm Beach County and Florida in 2019. In 2019, 324,367 Palm Beach County residents were enrolled in a form of school. Notably, $7.2 \%$ of these residents were enrolled in nursery school or preschool, which was higher than the state average of $6.3 \%$. Additionally, $4.6 \%$ of students were enrolled in kindergarten, $38.7 \%$ of students were enrolled in elementary school (grades 1-8), 21.7\% of students were enrolled in high school (grades 9-12), and $27.7 \%$ of students were enrolled in college or graduate school in Palm Beach County in 2019.

Table 47: School Enrollment, Palm Beach County and Florida, 5-Year Estimate, 2019

[^27]
## School Enrollment by Type

The table below shows school enrollment by grade for private and public schools in Palm Beach County and Florida in 2019. Palm Beach County had 325,355 residents aged 3 years and over enrolled in school in 2019. Across most categories, including kindergarten, grades 1 through 4 , grades 5 through 8 , grades 9 through 12 , undergraduate college, and graduate school, more children were enrolled in public schools as compared to private schools. The biggest gap between public and private school enrollment in the county was seen in grades 9 through 12, where 62,913 students were enrolled in public school and 9,909 students were enrolled in private school with a difference of 53,004 students. In regards to nursery and preschool, more students were enrolled in private options $(12,550)$ than public school $(10,407)$ in Palm Beach County. It is important to note that these rates were calculated using one-year estimates from the U.S. Census Bureau's American Community Survey, as opposed to the fuller five-year estimates that are used throughout the rest of this report

Table 48: School Enrollment by Type, Palm Beach County and Florida, 1-Year Estimate, 2019

| School Enrollment | Palm Beach County | Florida |
| :---: | ---: | ---: |
| Total Population Age 3 Years and Over | $1,453,797$ | $20,825,863$ |

## Educational Attainment

Research shows that there is a positive link between education, improved health, and life expectancy. Health disparities exist between those who have higher education and those with less education. This may be because education can typically lead to stable employment, higher pay and benefits, and employer-provided health insurance, which are associated with an increased access to care and resources. ${ }^{27}$

The following table depicts the educational attainment of residents in Palm Beach County and Florida in 2019. Among the Palm Beach County population that was age 25 years or older in 2019, 88.5\% obtained a high school diploma or higher, which was comparable to the state's percentage of $88.2 \%$. Additionally, a higher percentage of residents age 25 years or over obtained a Bachelor's degree or higher in Palm Beach County ( $36.7 \%$ ) compared to the state ( $29.9 \%$ ).

Table 49: Educational Attainment, Palm Beach County and Florida, 5-Year Estimate, 2019

|  | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Percent | Count | Percent |
| Population Age 25 years and over | $1,071,994$ | $100 \%$ | $14,965,745$ | $100 \%$ |
| Less than 9th grade | 61,660 | $5.8 \%$ | 718,909 | $4.8 \%$ |
| 9th to 12th grade, no diploma | 61,734 | $5.8 \%$ | $1,048,674$ | $7.0 \%$ |
| High school graduate (includes equivalency) | 257,316 | $24.0 \%$ | $4,276,237$ | $28.6 \%$ |
| Some college, no degree | 201,641 | $18.8 \%$ | $2,981,480$ | $19.9 \%$ |
| Associate's degree | 96,303 | $9.0 \%$ | $1,468,744$ | $9.8 \%$ |

[^28]Figure 19: Educational Attainment, Palm Beach County and Florida, 5-Year Estimate, 2019

Source: U.S Census Bureau, American Community Survey, 2019

The table below shows educational attainment by race and ethnicity in Palm Beach County and Florida in 2019. According to the most recent U.S. Census data, a larger percentage of White residents ( $91.1 \%$ ) obtained a high school diploma or higher as compared to Black residents ( $79.7 \%$ ). When comparing the attainment of a Bachelor's degrees or higher among these populations, the percentage of Black residents (20.7\%) to do so was nearly half that of White residents (40.2\%).

Educational attainment across ethnicities is also depicted. In 2019, 95.4\% of White, non-Hispanic residents obtained a high school degree or higher compared to $74.2 \%$ of Hispanic or Latino residents in Palm Beach County.
Furthermore, while $44.3 \%$ of White, non-Hispanic Palm Beach County residents obtained a Bachelor's degree or higher, only $24.6 \%$ of Hispanic and Latino residents did so. These disparities in educational attainment in certain races and ethnicities are similar across the state.

## High School Graduation Rates

Research has shown that the linkage of educational attainment to health inequalities begins during young adulthood. ${ }^{28}$ As such, high school graduation rates can be an important indicator when considering the health of a community.

The table below shows the high school graduation rates in Palm Beach County and Florida from the 2016-2017 school year through the 2019-2020 school year. Overall, graduation rates increased from the 2016-2017 school year to the 2019-2020 school year in Palm Beach County and Florida, with Palm Beach County increasing from $85.0 \%$ to $90.2 \%$ and Florida increasing from $82.3 \%$ to $90.0 \%$ during this time frame.

The Healthy People 2030 national target is to increase the proportion of high school students who graduate in four years after starting ninth grade to $90.7 \%$. The most recent national data shows that $85.8 \%$ of students graduated with a regular diploma in the 2018-2019 school year four years after starting ninth grade. ${ }^{29}$ While the Florida and Palm Beach County rates below do not specify graduation within four years of starting ninth grade, the data does show that Palm Beach County is close to reaching the target graduation rate, with a rate of $90.2 \%$ in the $2019-2020$ school year.

Table 51: High School Graduation Rates, Palm Beach County and Florida, School Years 2016-2017 Through 20192020

[^29]
## School Grades by Year

School grades are an indicator of individual school performance throughout the county. These grades are assigned by the Florida Department of Education and serve as a way for the Department to communicate how well each school is serving its students. It is important to note that on March 23, 2020, the Florida Department of Education Emergency Order No. 2020-EO-1 was issued in response to the COVID-19 pandemic and subsequently cancelled all spring K-12 statewide assessment tests. As such, accountability measures for the 2019-2020 school year that used statewide assessment data were not fully calculated. Additionally, on April 9, 2021, the Florida Department of Education Emergency Order No. 2021-EO-02 made the 2020-2021 school year school grades optional and gave schools the ability to choose to opt-in to this measure. ${ }^{30}$

The chart below depicts the school grades received by Palm Beach County schools by academic year from the 2014 - 2015 school year to the 2019-2020 school year. A full list of grades by school is included in Appendix A. Overall, school grades improved in Palm Beach County, reaching a five-year high in the count of " $A$ " grades ( $44.9 \%$ ) obtained by Palm Beach County schools and a five-year low in the count of "F" grades ( $0.0 \%$ ) obtained in the 2018 - 2019 school year.

Table 52: School Grades by Year (Average), Palm Beach County, 2014-2015 School Year Through 2018-2019 School Year

| School <br> Grade | $2014-\mathbf{2 0 1 5}$ |  | 2015-2016 |  | 2016-2017 |  | 2017-2018 |  | 2018-2019 |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |

[^30]
## Percentage of Total Students Passing, Score Of 3 and Above

Student pass rates are an indicator of student performance and can depict both English Language Arts and Mathematics aptitude.

The table below shows the percentage of total students passing with a score of three and above in Palm Beach County and Florida from the 2017-2018 through the 2020-2021 school years. In both English Language Arts and Mathematics, Palm Beach County's percentage exceeded the state's overall percentage each year from the 2017 2018 school year through the 2020-2021 school year. It is important to note that, in the 2019-2020 school year, Spring K-12 statewide assessments were canceled by Executive Order No. 2020-EO-1 due to the COVID-19 pandemic. As a result, school accountability measures were not calculated for the 2019-2020 school year.

Table 53: Percentage of Total Students Passing, Score of 3 and Above, Palm Beach County and Florida, School Years 2017-2018 Through 2020-2021

| School Year | Palm Beach County | Florida | Palm Beach County | Florida |
| :---: | :---: | :---: | :---: | :---: |
|  | English Language Arts Achievement Levels 3+ |  | Mathematics Achievement Levels 3+ |  |
| 2017-2018 | 58.2\% | 55.9\% | 62.0\% | 59.0\% |
| 2018-2019 | 58.9\% | 57.0\% | 63.4\% | 59.6\% |
| 2019-2020 | ---* | --* | --* | --* |
| 2020-2021 | 54.2\% | 52.8\% | 47.0\% | 48.4\% |

Note: *Pursuant to Florida Department of Education Emergency Order No. 2020-EO-1, spring K-12 statewide assessment test administrations for the 201920 school year were canceled and accountability measures reliant on such data were not calculated for the 2019-20 school year. Additionally, in April 2020, the U.S. Department of Education provided a Report Card waiver for requirements related to certain assessments and accountability that are based on data from the 2019-20 school year.

## Business and Employment

Employment can lead to positive outcomes such as a stable income and access to employer benefits, including health insurance. Research has shown that well-paying jobs play an important role in an individual's ability to live in a safe neighborhood, obtain education for their children, secure childcare services, and purchase healthy foods. Compared to their employed counterparts, unemployed Americans are more likely to be diagnosed with depression and have poorer health outcomes, including an increased risk of developing a stress-related condition such as stroke, heart attack, heart disease, or arthritis. ${ }^{31}$ The data presented in this section may be impacted in the future due to the COVID-19 pandemic. Bolstered healthcare workforce capacity, non-essential business closures, both temporary and permanent, and the closure of childcare centers and schools have posed challenges for employment and businesses beginning in 2020. ${ }^{32}$ Because employment plays a such a significant role in health, it is important to explore the employment status and employee characteristics of a community to better understand the population.

## Employment Status

Employment rate is positively correlated with both individual and community health. Research shows that mortality rates and rates of chronic diseases are lower among employed individuals compared to unemployed individuals. Quality, stable employment is known to reduce the risk of depression and psychological stress and improve overall mental health. ${ }^{33}$

The table below shows the employment status for Palm Beach County and Florida residents in 2019. Among the Palm Beach County population ages 16 years and older, $59.7 \%$ of residents were in the civilian labor force. Of those residents, $56.2 \%$ were employed and $3.5 \%$ were unemployed. This is comparable to the state rate, where $55.2 \%$ of the Florida population in the civilian labor force was employed and $3.3 \%$ were unemployed. Overall, Palm Beach County had an unemployment rate of $5.9 \%$ in 2019 , which was slightly above the state rate of $5.6 \%$.

[^31]Table 54: Employment Status, Palm Beach County and Florida, 5-year Estimate, 2019

## Unemployment Rate

Unemployment has adverse health consequences and can lead to lost wages and medical benefits, which ultimately can result in decreased access to care for individuals and their families. For these reasons, it is important to analyze unemployment as an indicator to health. Importantly, the data presented below include pre-pandemic figures. the recession that resulted from the COVID-19 pandemic exacerbated unemployment rates and pre-existing employment disparities, so it is possible that once more recent data becomes available, we will see an increase in the rate. ${ }^{34}$

The table below depicts the unemployment rate in Palm Beach County and Florida from 2015 to 2019. It is important to note that these rates were calculated using one-year estimates from the U.S. Census Bureau's American Community Survey, as opposed to the fuller five-year estimates that are used throughout the rest of this report. Overall, both Palm Beach County and the state of Florida unemployment rates gradually declined from 2015 to 2019. As of 2019, Palm Beach County had an unemployment rate of $5.2 \%$, while the state had a rate of $4.5 \%$.

Table 55: Unemployment Rate, Palm Beach County and Florida, 1-Year Estimate, 2019

| Year | Palm Beach County | Florida |  |
| :--- | ---: | ---: | :---: |
| 2015 | $6.9 \%$ | $7.0 \%$ |  |
| 2016 | $6.3 \%$ | $6.0 \%$ |  |
| 2017 | $5.9 \%$ | $5.5 \%$ |  |
| 2018 | $5.6 \%$ | $5.2 \%$ |  |
| 2019 | $5.2 \%$ | $4.5 \%$ |  |

[^32]
## Employment by Industry

Understanding residents' employment based on their industry can help public health agencies better anticipate the needs, services, and lifestyles of residents. Industry sectors determine a worker's potential health risks, working hours, and economic situation. All of these elements are important in planning and implementing health services. According to labor studies, jobs that are categorized as "blue-collar" often report increased physical demands and low flexibility of work hours. These characteristics are more frequently reported among lower socioeconomic classes. Alternatively, "white-collar" jobs are more likely to report high time pressure, frequent overtime, and poor work-life balance. ${ }^{35}$

The chart below depicts employment by industry for both Palm Beach County and Florida in 2019. Among Palm Beach County civilian workers ages 16 years and older, a majority worked in educational services, health care, and social assistance ( $20.9 \%$ ) industries. Professional, scientific, management, administrative, and waste management services ( $15.5 \%$ ) industries made up the second most populous group. The industry with the smallest percentage of the civilian population working was agriculture, forestry, fishing and hunting, and mining (1.0\%). These trends were consistent with those reported across the state of Florida.

Figure 25: Employment by Industry, Palm Beach County and Florida, 5-Year Estimate, 2019

| Industry | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Percent | Count | Percent |

| Educational services, and health care and <br> social assistance | 143,260 | $20.9 \%$ | $1,994,422$ | $21.0 \%$ |
| Arts, entertainment, and recreation, and <br> accommodation and food services | 80,117 | $11.7 \%$ | $1,162,995$ | $12.2 \%$ |
| Other services, except public administration | 40,546 | $5.9 \%$ | 498,858 | $5.3 \%$ |
| Public administration | 22,002 | $3.2 \%$ | 400,774 | $4.2 \%$ |

[^33][^34]
## Employment by Occupation

Similar to employment by industry, employment data based on occupation can help providers and community organizations better understand resident lifestyles and health needs. Studies show that workers with lower educational and occupational status are more likely to report poor self-rated health, limited physical functioning, and sickness-related absence. ${ }^{36}$

The following table shows occupation categories for Palm Beach County and Florida residents in 2019. These categories have different risks associated with their work and are important to consider when analyzing the health status and potential needs of the community. Palm Beach County civilian workers ages 16 years and older worked primarily in three occupational sectors: management, business, science, and arts occupations ( $37.3 \%$ ); sales and office occupations (23.5\%); and service occupations (21.8\%).

Figure 26: Employment by Occupation, Palm Beach County and Florida, 5-Year Estimate, 2019

| Occupation | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |

## Employment by Class of Worker

The table below shows the percentage of the working population in each class, including private wage and salary workers, government workers, self-employed workers, and unpaid family workers in Palm Beach County and Florida in 2019. Of the Palm Beach County workforce, $83.1 \%$ were private wage and salary workers, which was similar to the state's percentage of $82.4 \%$. Government workers made up $10.1 \%$ of the Palm Beach County workforce, while selfemployed workers made up $6.6 \%$ and unpaid family workers made up $0.2 \%$ of the workforce.

Figure 27: Employment by Class of Worker, Palm Beach County and Florida, 5-Year Estimate, 2019

| Class of Worker | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Percent | Count | Percent |
| Civilian employed population 16 years + | 684,112 | $100 \%$ | $9,495,353$ | $100 \%$ |
| Private wage and salary workers | 568,541 | $83.1 \%$ | $7,823,864$ | $82.4 \%$ |

## Public Assistance Benefits

Public assistance benefits serve as a valuable resource for community members. Such benefits provide a minimum level of financial security to those in need, usually based on low-income means-tested eligibility criteria, and buffer adverse health outcomes associated with socioeconomic disparities. ${ }^{37}$

As the COVID-19 pandemic began impacting employment, income, and education in 2020, many public assistance benefit programs experienced increased demand while balancing COVID-19 safety precautions in the delivery of these services. For example, federal school lunch program waivers initiated during the COVID-19 pandemic allowed schools to provide free meals on a grab-and-go basis when schools were conducting remote learning. Waiver programs like this impacted public assistance benefit utilization, and it is likely that impacts will be seen in the years following the data presented in this section. ${ }^{38}$ This section explores Free and Reduced Lunch at schools, SNAP participation, and the Older Americans Act in Palm Beach County.

## Free and Reduced Lunch Status

Nutrition is a vital component to a child's well-being and their ability to learn in the classroom. School lunches offer an opportunity for children to receive nutritious, filling foods that follow the standards from the National School Lunch Program. These free and reduced-price lunches are shown to reduce food insecurity, obesity rates, and poor health among students. ${ }^{39}$

The following table shows the count of free and reduced-price lunch eligible students in Palm Beach County and Florida during the 2020-2021 school year. During this timeframe, Palm Beach County had approximately 187,341 students. Of those students, $65.1 \%$ were eligible for free or reduced lunch or attended a Provision 2 school. This is slightly greater than the percentage in Florida, where $63.7 \%$ of students were eligible for free or reduced lunch or attended a Provision 2 school.

Table 56: Free and Reduced Lunch Status, Palm Beach County and Florida, School Year 2020-2021

|  | Total <br> Students | Percent <br> Eligible | \# of Free <br> Lunch <br> Students | \# of <br> Reduced- <br> Price <br> Lunch <br> Students | \# of <br> Provision 2 <br> Students | \# of Direct <br> Certification <br> CEP <br> Students |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Florida | $2,795,691$ | $63.7 \%$ | 967,002 | 106,611 | 939 | 472,872 |
| Palm Beach County | 187,341 | $65.1 \%$ | 110,872 | 10,793 | 350 | 0 |

Notes: Free = The student is eligible for free lunch; Reduced = The student is eligible for reduced price lunch; Provision $2=$ The student is enrolled in a USDA-approved Provision 2 school; Direct Cert = The student is enrolled in a USDA-approved Community Eligibility Provision (CEP) school and is identified as eligible for free meals based upon the Direct Certification Determination or the extension of eligibility to the household due to eligibility of an identified direct certified student.

## Students Qualifying for Free and Reduced Lunch, By School

When analyzed by school, free and reduced lunch qualifications can indicate need in a particular area. The following table depicts free and reduced lunch statuses for all Palm Beach County School District schools during the 2020 2021 school year. Please note that the full listing of schools is included in Appendix B. Among all Palm Beach County School District schools, $65.1 \%$ of students were eligible for free and reduced lunch or attended a Provision 2 school.

Table 57: Students Qualifying for Free and Reduced Lunch, By School, Palm Beach County, School Year 2020 2021

|  | Total <br> Students | Percent <br> Eligible | \# of Free <br> Lunch <br> Students | \# of <br> Reduced- <br> Price Lunch <br> Students | \# of <br> Provision 2 <br> Students | \# of Direct <br> Certification <br> CEP Students |

## SNAP Participation

Overall, food insecurity has been shown to increase the risk of adverse health outcomes and is linked with higher health care costs. Food insecurity can also complicate an individual's ability to manage illness, furthering health issues. Research shows that food insecurity is strongly correlated with chronic health conditions among children, working-age adults, and seniors. Additionally, the United States' anti-hunger program, the Supplemental Nutrition Assistance Program (SNAP), has been shown to improve health outcomes and lower healthcare costs for participants. SNAP works to improve food security and offers benefits that enable families to purchase healthier foods while saving money that can be used towards other health-promoting activities and medical care. SNAP participants are more likely to report excellent or very good health as compared to low-income non-SNAP participants. ${ }^{40}$

The table below depicts SNAP participation by ZIP code among age groups in Palm Beach County as of September 2021. Notably, over $50 \%$ of the population in ZIP codes 33407,33438 , and 33476 received SNAP benefits in September 2019. The ZIP code with the highest percentage of the population receiving SNAP in September 2021 was in Canal Point (56.7\%).

## Older Americans Act, Meals Clients

The Older Americans Act was initially passed by the United States Congress in 1965 to address concerns about inadequate social services for the elderly population. Today, the Older Americans Act authorizes a large scope of social and nutritional services for elderly individuals and their caregivers. ${ }^{41}$

The table below displays the number of Older Americans Act meal clients in Palm Beach County from 2016 to 2020. In 2020, there were 450,876 meals clients ages 60 and above and 3,097 active congregate meals clients. In addition to these congregate meal clients, there were 3,125 active home delivered meals clients. The total number of clients ages 60 and above and home delivered meals clients reached a five-year high in 2020.

Table 58: Older Americans Act, Meals Clients, Palm Beach County, 2016-2020

[^38]
## Housing

Housing that is stable, affordable, safe, and well-maintained is critical for health and community development. Research shows that community-wide efforts to stabilize housing have improved health outcomes and decreased health care costs for residents. ${ }^{42}$

According to early research, the COVID-19 pandemic has had a significant impact on housing across the United States. As such, the information presented in this section is likely to be impacted in future years following the COVID19 pandemic's surge in 2020. According to Habitat for Humanity, over 30\% of adults reported that their families could not afford all of their needs, including rent, mortgage, and utility bills in early 2020. Additionally, approximately $20 \%$ of households did not pay rent by the first of the month in June 2020 as the pandemic's impacts were being felt across communities. ${ }^{43}$ As a social determinant of health, housing is an important component in understanding a community's current health outlook and planning future efforts to improve the health and well-being of the community.

## Housing Occupancy

Vacant housing units can lead to negative consequences in the physical environment of a community. The table below depicts the housing occupancy and vacancy rates in Palm Beach County and Florida in 2019. During this year, $80.7 \%$ of housing units in Palm Beach County were occupied, while $19.3 \%$ of units were vacant. Rental units experienced a higher vacancy rate (8.2) as compared to homeowner units (1.9). The state of Florida saw similar trends, including $81.9 \%$ of all units classified as occupied and $18.1 \%$ as vacant in 2019.

[^39]
## Housing Tenure

Research has shown that housing insecurity has a significant impact on health outcomes and health equity. Programs that target housing affordability and the quality of housing can have a subsequent, if indirect, positive impact on health. This is significant for programs to consider as they target specific populations in their outreach to improve overall health in the community. ${ }^{44}$ As depicted in the table below, a majority of housing units in both Palm Beach County ( $68.9 \%$ ) and the state of Florida ( $65.4 \%$ ) were owner-occupied in 2019. However, nearly one-third of units in Palm Beach County ( $31.1 \%$ ) and Florida ( $34.6 \%$ ) were renter-occupied.

## Housing Value, Owner-Occupied Units

Housing value is an important indication of the cost of living and economic stability of a community. The table below shows the housing value of owner- occupied units in Palm Beach County and Florida in 2019. Among all owneroccupied housing units in Palm Beach County, the median value of housing units was approximately $\$ 283,600$ in 2019. That is higher than the state's median housing value of $\$ 215,300$.

Table 61: Housing Value, Owner-Occupied Units, Palm Beach County and Florida, 5-Year Estimate, 2019

|  | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Percent | Count | Percent |

## Evictions

Research indicates an association between evictions and negative health impacts, including birth outcomes, mental health hospitalizations, and all-cause mortality. Women, people of color, and families with children are at a higher risk for eviction compared to other groups. ${ }^{45}$

This table shows the number of evictions per 100 renter homes in Palm Beach County and Florida in 2016. The number of evictions per 100 renter homes in Palm Beach County ( $2.8 \%$ ) exceeded those of the state of Florida (2.53\%) in 2016. Additionally, there were approximately 14.56 evictions per day in Palm Beach County in 2016.

## Gross Rent

Average rent is another indicator of the economic status of a community. When residents face disproportionate rent costs compared to their income, they face economic challenges in seeking medical or health care. For this reason, average rent is an important consideration in understanding the health status of the county.

This table shows the gross rent in Palm Beach County and Florida in 2019. In Palm Beach County, there were approximately 165,753 occupied units paying rent in 2019. The median rent cost was $\$ 1,398$. That is slightly higher than the state's median rent cost of $\$ 1,175$.

Table 63: Gross Rent, Palm Beach County and Florida, 5-Year Estimate, 2019

## Gross Rent as a Percentage of Household Income (GRAPHI)

Gross Rent as a Percentage of Household Income (GRAPHI) is a measure that describes the percent of household income that is allocated to rent payments. ${ }^{46}$ The U.S. Department of Housing and Urban Development defines costburdened families as those who pay more than $30 \%$ of their income on housing. These residents may be living near poverty with challenges affording necessities such as food, transportation, and medical care. ${ }^{47}$

The table below shows GRAPHI in Palm Beach County and Florida in 2019. Overall, 59.3\% of Palm Beach County units paying rent in 2019 had a GRAPHI of over $30 \%$ compared to the state's percent of $56.3 \%$.

The Healthy People 2030 national target is to reduce the proportion of families that spend more than $30 \%$ of income on housing to $25.5 \%$. 48 It is important to note that while the Healthy People 2030 target focuses on income spent towards housing in general in the United States, the U.S. Census data available for Palm Beach County and Florida specifically captures income towards rent. Therefore, the information below reflects a smaller subset of the Healthy People 2030 national target topic. According to the data provided below, $59.3 \%$ of occupied Palm Beach County units paying rent spent over $30 \%$ of their income on housing. In Florida, $56.3 \%$ of occupied units paying rent spent over $30 \%$ of their household income on housing in 2019.

Table 64: Gross Rent as a Percentage of Income (GRAPHI), Palm Beach County and Florida, 5-Year Estimate, 2019

[^41]
## Households and Householders Living Alone

Social isolation can have a significant impact on health. Loneliness is associated with higher rates of depression, anxiety, and suicide. Additionally, social isolation can increase an individual's risk of premature death from all causes and is associated with a $50 \%$ increased risk of dementia. Older adults are at an increased risk for this isolation as they are more likely to live alone compared to other age groups. ${ }^{49}$

The table below depicts households and householders living alone in Palm Beach County and Florida in 2019. Nonfamily households in which the householder lives alone made up nearly one-third (31.0\%) of all households in Palm Beach County in 2019. This is higher than the state average, where $28.6 \%$ of householders lived alone. Among those ages 65 years and older, $16.8 \%$ lived alone in Palm Beach County compared to $12.9 \%$ across the state.
Table 65: Households and Householders Living Alone, Palm Beach County and Florida, 5-Year Estimate, 2019

## Transportation

Transportation is frequently cited as a barrier to accessing healthcare. When transportation barriers occur, residents may miss appointments or delay care because they do not have the ability to physically attend an appointment or pick up medications. Residents who are not able to access needed transportation, and thus are not able to seek timely care, experience poorer health outcomes. ${ }^{50}$ With the increased implementation of telehealth services in recent years, especially in light of the COVID-19 pandemic, the association between transportation and access to care may weaken. Additionally, impacts on income and employment as a result of the COVID-19 pandemic may lead to changes in transportation methods and utilization in future data. Importantly, a national study found a decrease in the use of all modes of transportation, but $35 \%$ of people using less transit increased their driving due to the ability to social distance. ${ }^{51}$

The following charts depict the outlook of transportation in Palm Beach County, as reported in the 2019 U.S. Census Bureau data. Vehicles available by household and workers who commute to work using public transit are important indicators in understanding the current status of transportation in Palm Beach County and will be vital to increasing access to healthcare services and ultimately improving health outcomes in future efforts.

## Vehicles Available by Household

Vehicles available by household can give providers and program managers insight into a resident's transportation options. This can help policymakers understand the challenges that residents face in accessing services.

The table below shows the vehicles available by household in Palm Beach County and Florida in 2019. In Palm Beach County, a majority of households reported having a vehicle available (41.3\%). Alternatively, 6.1\% of households did not have a vehicle available. This is comparable to the state of Florida, where $6.3 \%$ of households did not have a vehicle.

Table 66: Vehicles Available by Household, Palm Beach County and Florida, 5-Year Estimate, 2019

| Vehicles Available | Palm Beach County |  | Florida |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: |
|  | Count | Percent | Count | Percent |  |  |  |  |  |

[^43]
## Workers Who Commute to Work Using Public Transit, By Age

Well-designed and well-used public transportation systems can improve the health of communities by offering lowcost transportation options that reduce automobile congestion and the associated environmental impacts and health impacts. Public transportation systems offer solutions to families who face transportation barriers, which is one of the major issues related to access to health care. Public transportation also offers accessibility options for the elderly, disabled, and young adults. ${ }^{52}$ However, ill-maintained systems may result in low ridership due to the inconvenience of routes or bus stops, inconvenient timing options, or a lack of accessibility, especially for those with disabilities.

The following table shows the number and percentage of workers who commuted to work using public transit by age in Palm Beach County and Florida in 2019. The commute types depicted below can give insight into how Palm Beach County residents get to work, appointments, and other community activities. In Palm Beach County, most workers ages 16 years and older commuted by driving alone in a car, truck, or van ( $77.9 \%$ ). Alternatively, 10,967 workers (1.6\%) ages 16 years and older commute to work using public transportation, not including a taxi cab. Public transportation use was highest among workers ages 25 to 44 years old ( $42.6 \%$ ) and lowest among workers ages 16 to 19 years old ( $4.0 \%$ ) in Palm Beach County. The state of Florida showed a similar trend with public transportation use highest among workers ages 25 to 44 years old ( $41.4 \%$ ) and lowest among workers ages 16 to 19 years old (4.5\%).

## Workers Who Commute to Work Using Public Transit, By Race and Ethnicity

The table and graphs below show the number and percentage of workers who commuted to work using public transportation by race and ethnicity in Palm Beach County and Florida in 2019. Among those aged 16 years and over who commuted using public transportation in Palm Beach County, $45.3 \%$ of riders were White and $45.3 \%$ were Black. When looking at public transportation use by ethnicity in Palm Beach County, $27.2 \%$ of riders were of Hispanic or Latino origin compared to $24.6 \%$ who were non-Hispanic or Latino. The distribution between races and ethnicities in Palm Beach County was more equitable than the distribution seen across the state of Florida. In Florida, 36.7\% of public transport users were of Hispanic or Latino origin and $19.6 \%$ were non-Hispanic or Latino riders.

## Crime

According to the Centers for Disease Control and Prevention, if people feel unsafe in their community due to crime, they will be less likely to engage in outdoor physical activity or wellness activities, decreasing positive physical health outcomes and the sense of community within an area. Addressing exposure to crime through a public health lens is important in mitigating the negative effects from such exposure. ${ }^{53}$ Future data related to this section may show crime trends impacted by the COVID-19 pandemic. According to early research, general crime decreased across the United States as states initially entered lockdowns and restrictions to limit the spread of COVID-19. However, additional research is needed to understand subsequent changes in crime, as the general decrease reported nationally may be reflective of the overall reduction in volume of crime committed by young offenders and not necessarily indicative of less crime in the country. Other crimes, such as intimate partner violence, battery, and homicide may have in fact increased during this same time period. ${ }^{54}$ As new data becomes available covering crime during the COVID-19 pandemic, public health partners and community leaders should be aware of the impact of COVID-19 on the changing trends.

## Arrests

## Total Arrests

Total arrests serve as one indicator of crime in a community. The following table depicts total arrests in Palm Beach County in 2018 and 2019. The number of total arrests for both adults and juveniles in Palm Beach County decreased from 2018 to 2019. In 2019, there were 37,272 adult arrests, compared to 40,049 in 2018, and 3,220 juvenile arrests, compared to 3,695 in 2018.

While there is no Healthy People 2030 national target specific to general arrests, there is a national target to reduce the proportion of children with a parent or guardian who has served time in jail to $5.2 \% .55$

Table 69: Total Arrests, Palm Beach County, 2018 and 2019

| Year | Population | Total Arrests | Arrest Rate per <br> 100,000 | Total Adult <br> Arrests | Total Juvenile <br> Arrests |

## Arrests by Charge, Index Arrests

The table below shows the type of Index Arrests made in Palm Beach County in 2019. Understanding the reasons for an arrest can aid community partners in preparing services based on those reasons. Most Palm Beach County Index Arrests in 2019 were due to larceny ( 4,250 arrests) and aggravated assault (1,640 arrests).

## Arrests by Charge, Part II Arrests

Part II arrests are arrests that include manslaughter, kidnap/abduction, arson, simple assault, drug arrests, bribery, embezzlement, fraud, counterfeit/forgery, extortion/blackmail, intimidation, prostitution, non-forcible sex offenses, stolen property, DUI, destruction/vandalism, gambling, weapons violations, liquor law violations, and other miscellaneous offenses. ${ }^{56}$ The following table shows the Part II arrests by charge in Palm Beach County in 2019. A majority of Palm Beach County Part II arrests in 2019 were due to drug arrests $(5,633)$, simple assault $(3,849)$, or DUI $(2,214)$.

## Domestic Violence

## Domestic Violence by Offense Type by Victim's Relationship to Offender

Well-known or casual acquaintances account for $32 \%$ of all violent victimizations in the United States. ${ }^{57}$ The following table shows the number of domestic violence offenses by type and by the victim's relationship to the offender in Palm Beach County in 2019. Simple assault and aggravated assault accounted for a total of 3,255 arrests, or $97.6 \%$ of all domestic violence offenses. For both simple assault and aggravated assault, spouses were the most likely offenders, followed by cohabitants. Across all offenses, spouses were the most likely perpetrators of domestic violence offenses.

Healthy People 2030 has not set a national target for domestic violence.

## Health Status Profile

The monitoring of health indicators provides researchers, policymakers, organizations, and the general public with information on the health and well-being of regions and communities, and provides an overview of trends over time in health outcomes or behaviors that directly inform public policy, public health efforts, and planning for health services. ${ }^{58}$ Collecting and analyzing health indicators provides ample opportunities to make connections between the social determinants of health and their consequences on human health. The analysis of health indicators also provides a context to compare regions and communities with regards to health outcomes, and to determine whether national or local benchmarks are met in those regions for specific health indicators.

This section explores trends in several health indicators, including indicators for maternal health, behavioral health, morbidity, and mortality. The benefits of early and adequate prenatal care, breastfeeding, immunizations, and healthy birth weight are varied and well-reported, and are thus tracked in this report for Palm Beach County. ${ }^{59}$ It is also crucial to track mental and behavioral health, given that mental health disorders are associated with reductions in life expectancy, quality of life, and financial stability. ${ }^{6061}$ Common morbidities such as obesity, heart disease, cancer, diabetes, and hypertension are also included in this report given that these morbidities also contribute to the leading causes of mortality in Palm Beach County. Notably, heart disease and cancer alone are responsible for over 4 out every 10 deaths in Palm Beach County.

The impact of COVID-19 is also analyzed in this section. The economic, psychological, sociological, and health impacts of COVID-19 have been well-studied and reported. ${ }^{62636465}$ Importantly, Black and Hispanic populations in particular have reported disproportionate rates of COVID-19 related hospitalizations and death as compared to their white counterparts. ${ }^{66}$ Multiple social determinants of health, including but not limited to socioeconomic status, access to healthcare, environmental pollution, social support networks, education, and chronic stress are implicated in these disparities. ${ }^{67}$

[^50]
## COVID-19 Pandemic

Coronavirus Disease 2019, known as COVID-19, was first discovered in 2019 in Wuhan, China. This highly contagious disease is caused by the SARS-CoV-2 virus has quickly spread across the world, leading to mass lockdowns, infections, and deaths across the world. As of December 2021, there have been nearly 300 million reported cases of COVID-19 globally, including over 5 million deaths. ${ }^{68}$

As scientists and medical professionals raced to keep up with the spreading disease, the world learned that COVID19 most often causes respiratory symptoms similar to those of a cold, flu, or pneumonia. Some patients experience long-term health issues after infection, known as "long COVID." At the time of publication, professionals are still learning more about the long-term effects of COVID and the health consequences of "long COVID."69

On December 11, 2020, the first COVID-19 vaccine was authorized under the Food and Drug Administration's emergency use order. Since then, a number of additional vaccines have been made available and authorized for use among various aged population groups. It is important to note that authorizations were sought by age groups as the research was available and vetted, meaning that not all age populations had access to vaccines, or the same vaccines, at the same time. ${ }^{70}$

The COVID-19 pandemic has gripped the world since its initial spread, leading to mass lockdowns, school closures, public space closures, strained economic security, and more. The impact of COVID-19 on the socioeconomic, health, and health resource indicators featured throughout this report is unprecedented, and as of report publication, these impacts are continuing to be felt by residents of Palm Beach County, Florida, and beyond.

[^51]
## Cases

## COVID-19 Daily New Cases per 100,000 Population

The following table and figure show the rate of daily new COVID-19 cases per 100,000 population in Palm Beach County and Florida between March 1, 2020 and January 1, 2022. Both Palm Beach County and Florida followed similar trends throughout this timeframe. The rate among Palm Beach County residents peaked in August 2020, February 2021, and September 2021, followed by an exponential increase leading up to January 2022. The highest rate of new cases of COVID-19 in Palm Beach County during the reported period occurred in January 2022 (242.6 daily new cases per 100,000 population). While this data serves as an important marker for assessing the impact of the pandemic, it is important to note that due to how cases are counted, by COVID-19 tests that are reported (excluding at-home tests and the infected population who are either asymptomatic or symptomatic but forego testing), the below is likely an under-reporting of the actual total COVID-19 cases. Perhaps more appropriate indicators for assessing the impact of the pandemic, though lagging, are hospitalizations and deaths.

There is no Healthy People 2030 national target specific to this health indicator.

## Deaths

## Age-Adjusted Deaths from COVID-19

This table and figure show the age-adjusted death rate per 100,000 population from COVID-19 in Palm Beach County and Florida in 2020. In 2020, the death rate was 56.7 per 100,000 among Palm Beach County residents and 57.4 per 100,000 among Florida residents.

There is no Healthy People 2030 national target specific to this health indicator.

## Age-Adjusted Deaths from COVID-19, By Race

The table and figure below show the age-adjusted death rate per 100,000 population from COVID-19 in Palm Beach County and Florida in 2020 by race. In Palm Beach County and Florida, the rate among Black residents was over double the rate among White residents. The rate among Black residents in Palm Beach County was 123.2 per 100,000, while the rate among White residents was 48.4 per 100,000. Additionally, the rate among Black residents in Palm Beach County ( 123.2 per 100,000) was higher than the rate among Black residents in Florida ( 106.0 per 100,000) overall.

## Age-Adjusted Deaths from COVID-19, By Ethnicity

This table and figure show the age-adjusted death rate per 100,000 population from COVID-19 in Palm Beach County and Florida in 2020 by ethnicity. In both Palm Beach County and Florida, the rate among Hispanic residents was much higher than the rate among non-Hispanic residents. In Palm Beach County, the rate among Hispanic residents was 99.2 per 100,000, while the rate among non-Hispanic residents was 49.3 per 100,000. Additionally, the rate among Palm Beach County Hispanic residents ( 99.2 per 100,000) was higher than the rate among Florida Hispanic residents ( 89.9 per 100,000) overall.

## Vaccinations

## COVID-19 Vaccinations

The table and figure below show the percentage of the total population vaccinated for COVID-19 in Palm Beach County and Florida between January 1, 2021 and January 1, 2022. The rate of fully vaccinated residents in Palm Beach County and Florida followed a similar trend during this timeframe, with the percentage among Palm Beach County residents slightly higher than the percentage among Florida residents overall each month reported. The percentage of residents in Palm Beach County with one dose was slightly higher than the rate among fully vaccinated residents each month during this timeframe, as well.

There is no Healthy People 2030 national target specific to this health indicator.

## Maternal and Child Health

## Prenatal Care

## Births to Mothers with First Trimester Prenatal Care

Early prenatal care provides benefits to both mothers and their babies. ${ }^{71}$ Receiving care during the first trimester, defined as the first 12 weeks of pregnancy, is especially crucial. ${ }^{72}$ Receiving early medical attention can ensure that any medical conditions or potential complications are detected and addressed before they arise or worsen. ${ }^{73}$

This table below shows the percentage of births to mothers with first trimester prenatal care in Palm Beach County and Florida from 2016 to 2020. Between 2016 and 2020, the percentage of births to mothers receiving first trimester prenatal care decreased at both the state and county level. In Palm Beach County, the percentage decreased from $75.8 \%$ in 2016 to $73.8 \%$ in 2020.

The Healthy People 2030 national target is to increase the proportion of women who receive early and adequate prenatal care to $80.5 \% .^{74}$ Nationally, as of 2019, only $76.7 \%$ of women reported receiving such care. In Palm Beach County, $73.8 \%$ of women received early prenatal care in 2020.

[^55]
## Births to Mothers with First Trimester Prenatal Care, By Race

The racial and ethnic disparities that persist regarding access to prenatal care have implications for maternal health outcomes, underscoring the importance of early prenatal care. ${ }^{75}$

The table and graph below show the percentage of births to mothers with first trimester prenatal care by race in Palm Beach County and Florida from 2016 to 2020. Racial disparities in the percentage of births to mothers with first trimester prenatal care were found in both Palm Beach County and Florida during this time frame. Across all years, White mothers were more likely to receive first trimester prenatal care than Black mothers in Palm Beach County and Florida. In 2020, the gap between White and Black mothers in Palm Beach County was $7.9 \%$, with $76.1 \%$ of White mothers and $68.2 \%$ of Black mothers receiving first trimester care.
Table 79: Births to Mothers with First Trimester Prenatal Care, By Race, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

## Births to Mothers with First Trimester Prenatal Care, By Ethnicity

This table and graph below show the births to mothers with first trimester prenatal care by ethnicity in Palm Beach County and Florida from 2016 to 2020. In Florida, Hispanic mothers were found to be slightly more likely to have received first trimester prenatal care than non-Hispanic mothers. In Palm Beach County, however, Hispanic mothers were much less likely to receive first trimester prenatal care than non-Hispanic mothers across all years. In 2020, the gap between Hispanic and non-Hispanic mothers in Palm Beach County receiving early prenatal care was 11.4\%, which reflected a similar 10.3\% gap in 2016. Across all years, the percentage of mothers in Palm Beach County who received first trimester prenatal care remained below the Florida proportion.

Table 80: Births to Mothers with First Trimester Prenatal Care, By Ethnicity, Palm Beach County and Florida, 20162020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |

[^57]
## Births to Mothers with Third Trimester or No Prenatal Care

The third trimester of pregnancy begins during the $28^{\text {th }}$ week of gestation and ends with delivery. ${ }^{76}$ The risks of receiving late or no prenatal care are significant. Babies born to mothers who receive no prenatal care are three times more likely to have a low birth weight and five times more likely to die than those born to mothers who do get care. ${ }^{77}$

This table shows the percentage of births to mothers with third trimester or no prenatal care in Palm Beach County and Florida from 2016 to 2020. In the state of Florida, the percentage has grown from $6.1 \%$ in 2016 to $7.1 \%$ in 2020. In Palm Beach County, while the percentage has fluctuated, the overall percentage remained constant from $7.4 \%$ in 2016 to $7.4 \%$ in 2020 for mothers receiving third trimester or no prenatal care.

The Healthy People 2030 national target is to increase the proportion of women who receive early and adequate prenatal care to $80.5 \% .^{78}$ The data below shows that a low proportion of births occurred to mothers who received prenatal care in their third trimester or no prenatal care, with slight fluctuation, but a recent decrease from 2019 to 2020.

Table 81: Births to Mothers with Third Trimester or No Prenatal Care, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

## Births to Mothers with Third Trimester or No Prenatal Care, By Race

Racial and ethnic disparities also exist in third trimester or no prenatal care. The following table and graph show the percentage of births to mothers with third trimester or no prenatal care by race in Palm Beach County and Florida from 2016 to 2020. In both Palm Beach County and Florida, Black mothers were more likely to receive third trimester (late) or no prenatal care than White mothers between 2016 and 2020. The percentage of births to White mothers with third trimester or prenatal care in Palm Beach County increased each year from 2016 to 2019 and decreased in 2020 to $6.5 \%$. The percentage of births to Black mothers with third trimester or no prenatal care in Palm Beach County increased until 2018 and decreased from 2018 (12.9\%) to 2020 (9.3\%)

Table 82: Births to Mothers with Third Trimester or No Prenatal Care, By Race, Palm Beach County and Florida, 20162020

## Births to Mothers By Kotelchuck Prenatal Care Index By Mother's Education

The Kotelchuck Index, also referred to as the Adequacy of Prenatal Care Utilization (APNCU) Index, uses elements obtained from birth certificate data, including when prenatal care began (initiation) and the number of prenatal visits from when prenatal care began until delivery (received services), to determine the adequacy of prenatal care received. ${ }^{79}$ A ratio of observed to expected visits is calculated and grouped into four categories: Inadequate (received less than $50 \%$ of expected visits), Intermediate (received $50 \%-79 \%$ of expected visits), Adequate (received $80 \%$ $109 \%$ of expected visits), and Adequate Plus (received $110 \%$ or more of expected visits). ${ }^{80}$ The Kotelchuck Index is recommended for use among low-risk pregnancies because high-risk pregnancies tend to require more visits than would normally be expected.

As seen in the table below, mothers with lower levels of education attainment were more likely to have experienced inadequate levels of prenatal care than mothers with higher levels of education. The proportion of mothers who experienced inadequate prenatal care was $42 \%$ among mothers with eighth-grade education or less, $31 \%$ among mothers with some high school education, $18 \%$ for mothers with a GED, and $15 \%$ for mothers with some college but no degree.

The Healthy People 2030 national target is to increase the proportion of women who receive early and adequate prenatal care to $80.5 \% .{ }^{81}$ The data below shows that, in 2020, only $17.3 \%$ of births were to mothers who received inadequate prenatal care.

Table 84: Births by Kotelchuck Prenatal Care Index by Mother's Education, Palm Beach County, 2020

## Births to Mothers with Adequate Prenatal Care (Kotelchuck Index)

The table below shows the Kotelchuck Index, or births with adequate prenatal care, for both Palm Beach County and Florida in 2020. This includes both births to mothers with adequate prenatal care and adequate plus prenatal care. In Palm Beach County, the percent of adequate prenatal care that were Births with Adequate Prenatal Care (Kotelchuck Index) was $68.1 \%$ compared to Florida at $66.6 \%$.

The Healthy People 2030 national target is to increase the proportion of women who receive early and adequate prenatal care to $80.5 \% .^{82}$ As of 2020, Palm Beach County is not yet meeting this target.

Table 85: Births to Mothers with Adequate Prenatal Care (Kotelchuck Index), Palm Beach County and Florida, 2020

| Level of Prenatal Care | Palm Beach County |  | Florida |  |
| :--- | :---: | :---: | :---: | :---: |

## Maternal and Child Health: Overweight and Obesity

## Births by Mother's Pre-Pregnancy BMI

Having a high pre-pregnancy BMI is associated with various adverse health outcomes for mothers and newborns, including gestational diabetes, hypertension, preeclampsia, cesarean delivery, preterm delivery, large size for gestational age, and infant death. ${ }^{84}$

The following table shows the total number of births relative to mother's pre-pregnancy BMI in Palm Beach County from 2016 to 2020. In 2016, 6,898 mothers that gave birth in Palm Beach County had a normal pre-pregnancy BMI, but, by 2020, this number decreased to 5,920 .

The Healthy People 2030 national target is to increase the percentage of mothers with a healthy weight before pregnancy to $47.1 \% .{ }^{85}$ Nationally, as of $2018,42.1 \%$ of women had a healthy BMI prior to pregnancy. ${ }^{86}$ As of 2020, Palm Beach County was not yet meeting this target with $43.3 \%$ of births to women with normal weight.

Table 88: Births by Mother's Pre-Pregnancy BMI, Palm Beach County, 2016-2020

| Year | Palm Beach County |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |

[^61]
## Births to Overweight Mothers at the Time Pregnancy Occurred

As previously mentioned, mothers and their babies are at less risk for adverse health outcomes when a mother has a normal pre-pregnancy BMI. The following table shows the percent of births to overweight Palm Beach County mothers at the time pregnancy occurred from 2016 to 2020. In Palm Beach County, the percent of births to overweight mothers at the time of pregnancy increased from $25.9 \%$ in 2016 to $28.8 \%$ in 2020. This exceeded the overall percentage in the state of Florida ( $27.6 \%$ in 2020).

The Healthy People 2030 national target is to increase the percentage of mothers achieving a healthy weight before pregnancy to $47.1 \%{ }^{87}$ Although the below data refers to overweight mothers, a reduction in this indicator would indicate progress towards the Healthy People 2030 target; however, Palm Beach County has seen a steady increase.

Table 89: Births to Overweight Mothers at the Time Pregnancy Occurred, Palm Beach County and Florida, 20162020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |

## Births to Overweight Mothers at the Time Pregnancy Occurred, By Race

The table and graph below show the births to overweight mothers at the time pregnancy occurred by race in Palm Beach County from 2016 to 2020. As shown below, there were higher percentages of births to overweight Black mothers than White mothers in Palm Beach County in 2016, 2017, 2018, and 2020. In 2019, the percent of births to overweight Black mothers ( $28.4 \%$ ) fell just below the rate of births to overweight White mothers (28.6\%).

[^66]WIC

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) is a federally funded nutrition program that provides healthy foods, nutrition education and counseling, breastfeeding support, and health care referrals for families in need throughout Palm Beach County and the state of Florida. Prenatal WIC participation by low-income women is associated with fewer premature deaths, lower incidence of very low and low birth weight, reduced infant mortality, and an increased likelihood of receiving prenatal care. ${ }^{89}$ To be eligible for WIC services, families must meet the income thresholds based on household size.

The Florida Department of Health provides the following chart for eligibility determination. ${ }^{90}$

| Household Size | WIC Income Eligibility is Based on the Following Income Intervals |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: |
|  | Annual | Monthly | Twice-Monthly | Bi-Weekly | Weekly |
| 1 | $\$ 23,828$ | $\$ 1,986$ | $\$ 993$ | $\$ 917$ | $\$ 459$ |
| 2 | $\$ 32,227$ | $\$ 2,686$ | $\$ 1,343$ | $\$ 1,240$ | $\$ 620$ |
| 3 | $\$ 40,626$ | $\$ 3,386$ | $\$ 1,693$ | $\$ 1,563$ | $\$ 782$ |
| 4 | $\$ 49,025$ | $\$ 4,086$ | $\$ 2,043$ | $\$ 1,886$ | $\$ 943$ |
| 5 | $\$ 57,424$ | $\$ 4,786$ | $\$ 2,393$ | $\$ 2,209$ | $\$ 1,105$ |
| 6 | $\$ 65,823$ | $\$ 5,486$ | $\$ 2,743$ | $\$ 2,532$ | $\$ 1,266$ |
| 7 | $\$ 74,222$ | $\$ 6,186$ | $\$ 3,093$ | $\$ 2,855$ | $\$ 1,428$ |
| 8 | $\$ 82,621$ | $\$ 6,886$ | $\$ 3,443$ | $\$ 3,178$ | $\$ 1,589$ |

Note: For a pregnant woman, each unborn baby counts as 1 extra person in the house size.
Those with more than 8 individuals in the household can contact their local WIC office for details.

[^67]
## WIC Eligibles Served

The following chart shows the number of individuals eligible to receive WIC benefits who were served from 2016 to 2020. In 2020, the number of WIC eligibles served reached a five-year high in Palm Beach County with $75.8 \%$ served. This is significantly higher than the state percentage of $64.8 \%$ for the same year.

Healthy People 2030 has not set a national target for births to mothers participating in WIC.

## WIC Children >= 2 Years Who Are Overweight or Obese

Research shows that once obesity develops, weight issues are likely to persist throughout an individual's lifespan. Furthermore, rapid weight gain in infancy is strongly associated with obesity in childhood and adolescence. ${ }^{91}$ Understanding the rates of children who are two years old or younger who are overweight or obese can help provide insight on the current and future health of a population.

The table below shows the percentage of WIC children who were aged two years or younger and were either overweight or obese in Palm Beach County and Florida from 2016 to 2020. The percentage fluctuated slightly from 2016 to 2020 in Palm Beach County, with the most recent percentage reaching $29.8 \%$ in 2020. The percentage in the state of Florida increased slightly from $26.4 \%$ in 2016 to $28.3 \%$ in 2020. Despite increasing, the Florida percentage was still lower than the Palm Beach County percentage for each year reported.

There is no Healthy People 2030 national target directly related to this indicator.

## Birth Rates

## Total Resident Live Births

Live births rates are often used to determine sociological changes, including population changes, and to provide context to maternal health outcomes. ${ }^{92}$

The table below shows the rate of total resident live births per 1,000 population in Palm Beach County and Florida from 2016 to 2020. The total resident live birth rate was slightly lower in Palm Beach County compared to the state of Florida each year from 2016 to 2020. From 2016 to 2020, the rate in Palm Beach County decreased from 10.7 births per 1,000 population to 9.6 per 1,000 population. The state of Florida recorded a similar decreasing trend from 2016 ( 11.1 per 1,000 ) to 2020 ( 9.7 per 1,000).

## Births by Mother's Age and Race

Overall, $3,747,540$ births were reported in the United States in 2019, the latest available year for which there is data, down $1 \%$ from $2018 .{ }^{93}$ Nationally, birth rates decreased for females ages 15 to 34 years, increased for females ages 35 to 44 years, and were unchanged for females ages 10 to 14 years and 45 to 49 from 2018 to 2019. In 2019, the mean age of mothers at first birth was 27.0 years, an increase from 26.9 in 2018, and a record high for the nation.

The following table shows the total number of births by mother's age and race in Palm Beach County in 2020. In 2020, the most births in Palm Beach County were among White mothers ages 30 to 34 ( 3,127 births) and White mothers ages 25 to 29 ( 2,272 births). Of all births reported in Palm Beach County in 2020, 9,218 were among White women, 4,861 were among Black mothers and mothers of other races, and 33 were among an unknown race.

## Teenage Birth Rates and Repeat Teenage Birth Rates

Nationally, the percentage of births for females ages 15 to 19 years fell $4 \%$ between 2018 and 2019.94 Births to teenage mothers can have negative health, social, and economic effects for both mothers and their children. Teen births can prevent mothers from pursuing educational and workforce opportunities and repeat teen births may be more likely to be preterm or of low birthweight than first teen births. ${ }^{95}$

## Repeat Births to Mothers Ages 15-17

The table below shows the percentage of repeat births to mothers ages 15 to 17 years in Palm Beach County and Florida from 2016 to 2020. In this time period, repeat births to mothers ages 15 to 17 were highest in 2018 for Palm Beach County ( $8.4 \%$ ). In 2020, $8.2 \%$ of births were repeat births to mothers ages 15 to 17 in Palm Beach County, which was higher than the statewide rate of $6.2 \%$.

The Healthy People 2030 national target for pregnancies among mothers ages 15 to 19 is to reduce pregnancies in adolescents to 31.4 per 1,000 females. ${ }^{96}$ Although the data below shows total repeat births to teen mothers ages 15 to 17 , there is a recent increase reported from $6.0 \%$ in 2019 to $8.2 \%$ in 2020.

Table 100: Repeat Births to Mothers Ages 15-17, Palm Beach County and Florida, 2016-2020

## Repeat Births to Mothers Ages 15-17, By Race

An examination of teen repeat births by race can inform the health system of disparities among certain subpopulations and help providers target their efforts to reduce repeat birth rates among teens. This table and graph below show the percent of repeat births to mothers ages 15 to 17 by race in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, with the exception of 2017 and 2020, White mothers were much more likely than Black mothers ages 15 to 17 to have a repeat birth during this time frame. Notably, the White percentage was higher and the Black percentage was lower in Palm Beach County as compared to the state percentage for each year from 2016 to 2019. Palm Beach County Black mothers also reported a very sharp increase from $3.6 \%$ in 2019 to $9.0 \%$ in 2020.

Table 101: Repeat Births to Mothers Ages 15-17, By Race, Palm Beach County and Florida, 2016-2020

| Y Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | White |  | Black |  |
| White | Black |  |  |  |
| 2016 | $7.3 \%$ | $3.9 \%$ | $7.2 \%$ | $7.4 \%$ |
| 2017 | $8.2 \%$ | $8.5 \%$ | $6.7 \%$ | $9.7 \%$ |
| 2018 | $7.8 \%$ | $3.9 \%$ | $6.8 \%$ | $6.7 \%$ |
| 2019 | $7.8 \%$ | $3.6 \%$ | $5.4 \%$ | $8.2 \%$ |
| 2020 | $7.2 \%$ | $9.0 \%$ | $5.6 \%$ | $7.6 \%$ |

## Repeat Births to Mothers Ages 15-17, By Ethnicity

A deeper look into repeat births by ethnicity can highlight the need for culturally competent services within the health care system. This table and graph below show the percentage of repeat births to mothers ages 15 to 17 by ethnicity in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, Hispanic mothers ages 15 to 17 consistently reported higher percentages of repeat births as compared to their non-Hispanic counterparts between 2016 and 2019. In 2020, Hispanic mothers reported a lower percentage (7.5\%) compared to their non-Hispanic counterparts $(9.3 \%)$. A similar trend was seen at the state level. However, disparities between Hispanic mothers and non-Hispanic mothers ages 15 to 17 were much higher in Palm Beach County as compared to the state of Florida.

Table 102: Repeat Births to Mothers Ages 15-17, By Ethnicity, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Hispanic | Non-Hispanic | Hispanic | Non-Hispanic |
| 2016 | $10.1 \%$ | $2.0 \%$ | $7.5 \%$ | $7.1 \%$ |
| 2017 | $9.1 \%$ | $6.9 \%$ | $7.5 \%$ | $7.9 \%$ |
| 2018 | $9.4 \%$ | $2.9 \%$ | $6.1 \%$ | $7.0 \%$ |
| 2019 | $8.5 \%$ | $2.9 \%$ | $6.1 \%$ | $7.4 \%$ |

## Repeat Births to Mothers Ages 18-19

The following table shows the percentage of repeat births to mothers ages 18 to 19 in Palm Beach County and Florida from 2016 to 2020. Repeat births to mothers ages 18 to 19 have declined overall in both Palm Beach County and Florida. Peak repeat birth percentages among mothers ages 18 to 19 were reported in 2016 for Palm Beach County ( $20.6 \%$ ) and Florida ( $19.0 \%$ ). The lowest repeat birth percentages among mothers ages 18 to 19 were reported in 2020 in Palm Beach County (13.7\%) and Florida (15.5\%).

The Healthy People 2030 national target for pregnancies among mothers ages 15 to 19 is to reduce pregnancies in adolescents to 31.4 per 1,000 females. ${ }^{97}$ Although the data below shows total repeat births to teen mothers ages 18 to 19 , there is a recent decrease reported from $15.4 \%$ in 2019 to $13.7 \%$ in 2020.

Table 103: Repeat Births to Mothers Ages 18-19, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

## Birth Weight

## Live Births Under 1500 Grams (Very Low Birth Weight)

Approximately one percent of babies in the United States are born with very low birth weight. ${ }^{98}$ Very low birth weight often coincides with premature birth and various health complications.

The following table shows the percent of live births under 1500 grams, indicating a very low birth weight, in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the percentage of live births under 1500 grams was slightly below the state's overall percentage every year, with the exception of 2019. Palm Beach County reported its highest percentage of $1.8 \%$ in 2019. In 2020, this percentage decreased to $1.4 \%$.

Healthy People 2030 has not set a national target for rates of very low birth weight. However, very low birth weight births in Palm Beach County have recently decreased from $1.8 \%$ in 2019 to $1.4 \%$ in 2020.

Table 106: Live Births Under 1500 Grams (Very Low Birth Weight), Palm Beach County and Florida, 2016-2020

[^79]
## Live Births Under 2500 Grams (Low Birth Weight)

The World Health Organization defines low birth weight as a birth weight under 2500 grams, regardless of gestational age. ${ }^{99}$ Low birth weight babies are twenty times more likely to develop complications and die in comparison to normal weight babies. ${ }^{100}$

This table below shows the percentage of live births under 2500 grams in Palm Beach County and Florida from 2016 to 2020. Each year during this timeframe, the percentages in Palm Beach County and Florida were similar. Additionally, the Palm Beach County percentage was lower than the Florida percentage in 2016, 2017, 2018, and 2020. In 2019, Palm Beach County reported its highest percent of live births under 2500 grams during this timeframe at 9.0\%.

Healthy People 2030 has not set a national target for rates of low birth weight. However, low birth weight births in Palm Beach County have recently decreased from $9.0 \%$ in 2019 to $8.3 \%$ in 2020.

Table 109: Live Births Under 2500 Grams (Low Birth Weight), Palm Beach County and Florida, 2016-2020

[^82]
## Premature Births

A premature birth is a birth that takes place more than three weeks before a baby's estimated due date or before the start of the 37 th week of pregnancy. ${ }^{101}$ Premature births are associated with numerous health problems for newborns. Nationally, premature birth rates rose for the fifth straight year in 2019. ${ }^{102}$ Additionally, racial and ethnic differences in premature birth rates continue to persist. In 2019, the proportion of premature birth among AfricanAmerican women in the United States was 14.4\%, as compared to $9.3 \%$ among White women and $10 \%$ among Hispanic women.

## Premature Births

The table below shows the percentage of premature births in Palm Beach County and Florida from 2016 to 2020. During that timeframe, Palm Beach County saw an overall increase from $9.2 \%$ to $9.5 \%$, while Florida saw an increase of $10.1 \%$ to $10.5 \%$. Palm Beach County reported a notable drop from $10.5 \%$ in 2019 to $9.5 \%$ in 2020.

The Healthy People 2030 national target is to reduce the percentage of premature births to $9.4 \% .{ }^{103}$ As of 2020, Palm Beach County was not yet meeting this target, with $9.5 \%$ of births occurring before the $37^{\text {th }}$ week of pregnancy.

## Infant Mortality

## Infant Deaths per 1,000 Live Births

Infant mortality is the death of an infant before his or her first birthday. In 2019, the infant mortality rate in the United States was 5.6 deaths per 1,000 live births. 104

The following table shows the rate of infant deaths per 1,000 live births in Palm Beach County and Florida from 2016 to 2020. For each year between 2016 and 2020, Palm Beach County reported lower infant mortality rates than the state of Florida.

Healthy People 2030 has set a national target of 5.0 deaths per 1,000 live births. ${ }^{105}$ As of 2020, Palm Beach County is meeting this target with a rate of 3.8 deaths per 1,000 live births.

Table 114: Infant Deaths per 1,000 Live Births, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Rate | Raunt |

## Infant Deaths per 1,000 Live Births, By Race

The table and graph below show the rate of infant deaths per 1,000 live births by race in Palm Beach County from 2016 to 2020. Tremendous disparities by race existed each year during this time frame. In 2020, the rate of infant deaths per 1,000 live births among White residents in Palm Beach County reached 2.6 per 1,000 live births, whereas the rate among Black residents was 6.3 per 1,000 live births, exceeding the Healthy People 2030 national target of 5.0 deaths per 1,000 live births.

## Infant Deaths per 1,000 Live Births, By Ethnicity

The table and graph below show the rate of infant deaths per 1,000 live births by ethnicity in Palm Beach County from 2016 to 2020. The rate of infant deaths per 1,000 live births for Hispanic residents was higher than for nonHispanic residents from 2016 to 2018, but lower than non-Hispanics in 2019 and 2020. In 2020, the rate of infant deaths per 1,000 live births was 2.7 for Hispanic residents and 4.1 for non-Hispanic residents.

[^88]
## Fetal Deaths per 1,000 Live Births

Fetal death refers to the death of a fetus at any time during pregnancy. ${ }^{106}$ Fetal deaths later in pregnancy, at 20 weeks of gestation or more, are sometimes referred to as stillbirths. As of 2017, the United States reported 5.9 fetal deaths at 20 or more weeks of gestation per 1,000 live births. ${ }^{107}$

The table below shows the rate of fetal deaths per 1,000 live births in Palm Beach County and Florida from 2016 to 2020. Florida rates of fetal death remained between 6.7 and 6.9 during this five-year period, whereas Palm Beach County rates fluctuated. The highest rate reported in Palm Beach County in this five-year time period was 7.3 in 2016 and the lowest was 4.4 in 2018.

Healthy People 2030 has set a national target of 5.7 fetal deaths per 1,000 live births. ${ }^{108}$ In 2020, Palm Beach County reported a fetal death rate of 6.3 per 1,000 live births and is not meeting this target.

Table 117: Fetal Deaths per 1,000 Live Births, Palm Beach County and Florida, 2016-2020

## Fetal Deaths per 1,000 Live Births, By Race

The following table and graph show the fetal death rate per 1,000 live births by race in Palm Beach County from 2016 to 2020. Black residents in Palm Beach County had much higher rates of fetal death compared to White residents in Palm Beach County during this five-year period. In 2020, the rate of fetal deaths per 1,000 live births to Black mothers was 10.7, whereas the rate of fetal death to White mothers was 4.8 , reflecting a rate two times higher among Black mothers. The rate among Black mothers also far exceeded the Healthy People 2030 national target of 5.7 deaths per 1,000 live births.

## Fetal Deaths per 1,000 Live Births, By Ethnicity

The table and graph below show the fetal death rate per 1,000 live births by ethnicity in Palm Beach County and Florida from 2016 to 2020. Hispanic residents in Palm Beach County had lower fetal death rates compared to nonHispanic mothers each year during this time period. Most recently in 2020, Hispanic residents experienced a fetal death rate of 5.0 per 1,000 live births and non-Hispanic mothers had a rate of 6.5 per 1,000 live births.

Table 119: Fetal Deaths per 1,000 Live Births, By Ethnicity, Palm Beach County, 2016-2020

[^91]
## Breastfeeding

Breastfeeding has long been shown to have a wealth of health benefits to both mother and newborns and infants. For example, breastfeeding provides an important opportunity to facilitate skin-to-skin contact between mothers and newborns and infants, has been shown to be a protective factor against postpartum depression, and provides nutritional, immune, and cognitive benefits to newborns and infants. ${ }^{109}$

## Mothers Who Initiate Breastfeeding

The table below shows the percentage of mothers who initiated breastfeeding in Palm Beach County and Florida from 2016 to 2020. Mothers in Palm Beach County reported higher percentages of breastfeeding initiation compared to mothers in Florida for every year during this time frame, except 2019. In 2020, the percent of mothers who initiated breastfeeding in Palm Beach County was $87.1 \%$, while in the state of Florida it was $85.4 \%$.

The Healthy People 2030 national target is to increase the percent of infants that are breastfed exclusively up to six months of age to $42.4 \% .{ }^{110}$ Although the data below does not show the proportion of infants who are exclusively breastfed for their first 6 months, each year from 2016 to 2020 , over $85 \%$ of total births were among mothers who initiated breastfeeding after birth.

Table 120: Mothers Who Initiate Breastfeeding, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Percent | Count |
| 2016 | 13,083 | $87.4 \%$ | 193,508 | $86.0 \%$ |
| 2017 | 13,490 | $89.7 \%$ | 192,199 | $86.0 \%$ |
| 2018 | 13,340 | $88.6 \%$ | 190,949 | $86.2 \%$ |
| 2019 | 12,597 | $85.5 \%$ | 189,255 | $86.0 \%$ |
| 2020 | 12,294 | $87.1 \%$ | 179,098 | $85.4 \%$ |

[^92]
## Immunization

Immunizations protect young children from multiple deadly diseases and work to prevent the transfer of such diseases from child to child. ${ }^{111}$ It is one of public health's leading health indicators and a primary defense against some of the most deadly and debilitating diseases known. If a community or population has 'herd immunity', the large number of individuals who are immune to a disease, such as those vaccinated, can reduce the probability of an infection spreading to those who are not immune. Because of advances in medical science, children can be protected against more diseases than ever before. Some diseases that once injured or killed thousands of children have been eliminated completely and others are close to extinction- primarily due to safe and effective vaccination. For instance, immunizations have largely eradicated diseases such as polio, tetanus, and rubella.

## Fully Immunized Children, Age Two

The table below shows the proportion of fully immunized children age two in Palm Beach County and Florida from 2015 to 2019. From 2017 to 2019, the proportion of fully immunized children age two for Palm Beach County were lower than the Florida proportion. In 2019, Palm Beach County reported that $76.0 \%$ of children age two were fully immunized, whereas $83.5 \%$ of children age two across the state of Florida were fully immunized.

Healthy People 2030 has set a national target to reduce the proportion of children who get no recommended vaccines by age two years to $1.3 \% .^{112}$ While the below data shows fully immunized children, increases in this proportion would indicate progress towards this target. While Palm Beach County has seen a recent increase from $73.8 \%$ in 2018 to $76 \%$ in 2019, the proportion of fully immunized children has fluctuated but ultimately declined from 2015 (85.4\%) to 2019 (76\%).

## Immunization Levels in Kindergarten

This table and graph below show the proportion of immunization levels in Kindergarten for Palm Beach County and Florida from 2016 to 2020. The percentage of immunized Palm Beach County Kindergarteners was lower than that of Florida each year from 2016 to 2020. From 2019 to 2020, the percent of immunized Kindergarteners decreased from $93.5 \%$ to $92.1 \%$ in Palm Beach County.

Table 122: Immunization Levels in Kindergarten, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

[^94]
## Vaccine Preventable Diseases

## Selected Vaccine Preventable Disease Rate

Vaccines are generally effective at preventing diseases for individuals of all ages. ${ }^{113}$ Due to vaccination campaigns, certain diseases, such as polio and diphtheria, are no longer problematic in the United States. ${ }^{114}$ Vaccine preventable diseases are monitored to identify gaps in vaccine coverage.

This table shows the selected vaccine preventable disease rate in Palm Beach County and Florida from 2013 to 2017. The selected vaccines here include diphtheria, acute hepatitis B, measles, mumps, pertussis, rubella, tetanus, and polio. Between 2013 and 2016, Palm Beach County reported lower rates of vaccine preventable diseases than the state of Florida. In 2017, the latest year for which data is available, the Palm Beach County rate of 6.0 per 100,000 rose higher than Florida's rate of 5.8 per 100,000.

Healthy People 2030 has not set a national target for a vaccine preventable disease rate for diphtheria, acute hepatitis B , measles, mumps, pertussis, rubella, tetanus, and polio. However, related national targets include to: maintain the elimination of measles, rubella, congenital rubella syndrome, and polio at 0 endemic cases; reduce the rate of acute hepatitis $B$ to 0.1 per 100,000 population; and reduce cases of pertussis among infants to 2,387 cases. ${ }^{115} 116117$

Table 124: Selected Vaccine Preventable Disease Rate, Palm Beach County and Florida, 2013-2017

| Year | Palm Beach County |  | Florida |  |

[^95]
## Oral Health

Dental conditions that go untreated can lead to negative health outcomes. ${ }^{118}$ Tooth decay and periodontal disease, for instance, are associated with a number of life-threatening conditions, including sepsis, diabetes, and heart disease. Many Americans delay or do not receive dental care despite its association with general health outcomes. Individuals without a usual source of dental care may visit hospital emergency departments for treatment. The cost of dental-related visits that are treated in the emergency room exceeded \$2 billion nationally in 2017.119 Importantly, evidence suggests that people with COVID-19 who have severe gum disease are also at increased risk for severe illness. ${ }^{120}$

## Preventable Hospitalizations Under 65 From Dental Conditions

The following table shows the rate of preventable hospitalizations from dental conditions for individuals under age 65 per 100,000 population under age 65 in Palm Beach County and Florida from 2015 to 2019. Every year during this time frame, Palm Beach County reported a higher rate than the Florida rate. The lowest rate reported for Palm Beach County ( 12.4 per 100,000 population) in this timeframe was in 2019.

While Healthy People 2030 has not set a national target for preventable hospitalizations from dental conditions for those under 65 , there is a national target to reduce the proportion of people who can't get the dental care they need when they need it. ${ }^{121}$ Perhaps if people did receive adequate dental care, there would be a reduction in these hospitalizations.

Table 125: Preventable Hospitalizations Under 65 from Dental Conditions, Rate Per 100,000 Population Under 65, Palm Beach County and Florida, 2015-2019

[^96]
## Behavioral Health

## Mental Health

## Adults with Good Mental Health

Poor mental health status affects the quality of social, work and other relationships, increases the likelihood of substance misuse, and is associated with a variety of negative health outcomes. ${ }^{122}$ Mental health status has potentially only worsened for many adults during the COVID-19 pandemic due to such factors as isolation and stress. The absence of good mental health can reduce the ability of individuals to work, maintain relationships, and avoid addictive substances.

The table below shows the rate of adults with self-reported 'good mental health' in Palm Beach County and Florida in 2013, 2016, and 2019. From 2013 to 2016, Palm Beach County reported a $2.1 \%$ drop in the percentage of 'adults with good mental health,' followed by a $2.5 \%$ increase from 2016 to 2019. In the state of Florida, the percentage increased $1.3 \%$ between 2013 and 2016, but decreased $2.4 \%$ between 2016 and 2019. Additionally, the percentage of 'adults with good mental health' was higher in Palm Beach County (90.8\%) than in Florida (86.2\%) in 2019.

Healthy People 2030 has not set a national target for the percentage of adults with good mental health.
Table 126: Adults with Good Mental Health, Palm Beach County and Florida, 2013, 2016, 2019

[^97]
## Adults Who Had Poor Mental Health On > 14 Of the Past 30 Days

As mentioned above, adults with self-reported 'poor mental health' may face difficulties with social and economic opportunities and may encounter worse health outcomes as compared to adults with good mental health. The table below shows the percentage of adults with 'poor mental health' on more than 14 of the past 30 days in Palm Beach County and Florida in 2013, 2016, and 2019. In Palm Beach County, the percentage of adults with 'poor mental health' on more than 14 of the past 30 days increased $2.1 \%$ from 2013 to 2016, and decreased $2.5 \%$ from 2016 to 2019. Most recently in 2019, the rate of adults with 'poor mental health' on more than 14 of the past 30 days was $9.2 \%$ in Palm Beach County, much lower than the Florida rate of $13.8 \%$.

Healthy People 2030 has not set a national target for the percentage of adults with poor mental health on more than 14 of the past 30 days.

## Adults Who Had Poor Mental Health On > 14 Of the Past 30 Days, By Race and Ethnicity

The table below shows the percentage of adults with 'poor mental health' on more than 14 of the past 30 days, by race and ethnicity, in Palm Beach County and Florida in 2013, 2016, and 2019. In Palm Beach County, percentages fluctuated among all racial and ethnic groups. Between 2013 and 2019, White adults in Palm Beach County reported a low of $9.8 \%$ and a high of $13.9 \%$. During this same time period, Black adults in Palm Beach County reported a low of $1 \%$ and a high of $13.4 \%$. The Palm Beach County Hispanic population reported a low of $5.7 \%$ and a high of $10.8 \%$. In 2013 and 2019, Florida consistently reported higher percentages than Palm Beach County.

Table 128: Adults with Poor Mental Health on > 14 of the Past 30 days, By Race and Ethnicity, Palm Beach County and Florida, 2013, 2016, 2019

## Adults Who Have Ever Been Told They Have a Depressive Disorder

For many people with depression, symptoms are often severe enough to cause noticeable problems in daily activities, including work, school, or social relationships. ${ }^{123}$ The following table shows the percentage of adults who have ever been told they have a depressive disorder in Palm Beach County and Florida in 2013, 2016, and 2019. In Palm Beach County, this percentage decreased steadily from $13.8 \%$ in 2013 to $12.4 \%$ in 2019, and was lower than the Florida rate for each year reported. In Florida, the rate dropped from $16.8 \%$ in 2013 to $14.2 \%$ in 2016, and then rose to $17.7 \%$ in 2019.

Healthy People 2030 has not set a national target for the percentage of adults who have ever been told they have a depressive disorder; however, there is a related national target to increase the proportion of adults with depression who get treatment. ${ }^{124}$

## Adults Whose Poor Physical or Mental Health Kept Them from Usual Activities (>14 Of the Past 30 Days)

The table below shows the rate of adults whose poor physical or mental health kept them from usual activities for more than 14 of the past 30 days. In Palm Beach County, there was a sharp $8.3 \%$ increase between 2013 (11.4\%) and 2016 ( $19.7 \%$ ) and a $5.7 \%$ decrease between 2016 (19.7\%) and 2019 (14.0\%). In 2019, the Palm Beach County rate of $14.0 \%$ was much lower than the Florida rate of $18.3 \%$.

Healthy People 2030 has not set a national target for the percentage of adults whose poor physical or mental health kept them from usual activities in more than 14 of the past 30 days.
Table 130: Adults Whose Poor Physical or Mental Health Kept Them from Usual Activities (>14 of the past 30 days), Palm Beach County and Florida, 2013, 2016, 2019

## Suicide

In 2019, suicide was the tenth leading cause of death in the United States with 47,511 deaths attributed to intentional self-harm. ${ }^{125}$ Suicides are often considered preventable through evidence-based, low-cost interventions. ${ }^{126}$ Suicide rates have increased over the past two decades. ${ }^{127}$ Suicide rates may also be impacted by the effects of the COVID19 pandemic

## Age-Adjusted Suicide Death Rate

The table below shows the age-adjusted suicide death rate per 100,000 population in Palm Beach County and Florida from 2015 to 2019. The suicide rate in Palm Beach County decreased from 2015 ( 15.5 per 100,000) to 2017 ( 12.2 per 100,000), then increased in 2018 ( 15.4 per 100,000), and decreased in 2019 ( 13.9 per 100,000). Most recently in 2019, the Palm Beach County rate of 13.9 per 100,000 population was slightly lower than the Florida rate of 14.5 per 100,000 population.

The Healthy People 2030 national target is to reduce the rate of deaths by suicide to 12.8 deaths per 100,000 population. ${ }^{128}$ As of 2019, Palm Beach County is not meeting this target.

## Suicide Death Count by Age

Historically, younger individuals have reported lower suicide rates as compared to middle aged and older individuals, and according to the American Foundation for Suicide Prevention, the highest rates of suicide in the United States are reported among middle-aged White males. ${ }^{129}$ When looking at racial differences in suicide rates, the highest ageadjusted suicide rate in the United States was found among White individuals, with Black, Asian and Hispanics reporting the lowest rates.

The table below shows the deaths by suicide count by age in Palm Beach County from 2015 to 2019. When looking at the total number of deaths by suicide from 2015 to 2019 for each age group, the highest deaths by suicide count was reported among those ages 55 to 64 (245), followed by those ages 45 to 54 (211), and those ages 65 to 74 (162). From 2018 to 2019, every age group saw a decrease in total deaths by suicide in Palm Beach County, except among those aged 85 and over.

The Healthy People 2030 national target is to reduce the rate of suicide deaths to 12.8 suicides per 100,000 population. While the data below shows total deaths by suicide counts, any reduction in these numbers is progress towards a healthier community.

Table 132: Suicide Death Count, By Age, Palm Beach County, 2015-2019

| Age | Year |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |

## Suicide Death Count, By Race

The following table shows the deaths by suicide count by race in Palm Beach County from 2015 to 2019. Each year during this time frame, the deaths by suicide count for White individuals far exceeded the count for Black, Other, and Unknown races combined. Additionally, the number of deaths by suicide for White individuals fluctuated from 2015 to 2019, but decreased from 226 in 2018 to 204 in 2019.

Table 133: Suicide Death Count, By Race, Palm Beach County, 2015-2019

| Year | Palm Beach County |  |  |  |  |

## Suicide Death Count, By Ethnicity

The table below shows the deaths by suicide count by ethnicity in Palm Beach County from 2015 to 2019. The nonHispanic deaths by suicide count was much higher than the Hispanic count in Palm Beach County each year from 2015 to 2019. Most recently, the deaths by suicide count declined for non-Hispanics (from 217 in 2018, to 201 in 2019), and for Hispanics (from 27 in 2018, to 24 in 2019).

Table 134: Suicide Death Count, By Ethnicity, Palm Beach County, 2015-2019

## Crude Suicide Death Rate

The table below shows the crude suicide death rate in Palm Beach County and Florida from 2016 to 2020. The crude suicide death rate in Palm Beach County was higher than the Florida rate in 2015, 2016, and 2018. Palm Beach County reported its lowest rate in 2020 (at 11.6 per 100,000 population), and its highest in 2018 (at 17.1 per 100,000 population). In 2020, the crude suicide death rate in Palm Beach County ( 11.6 per 100,000) was lower than the statewide rate ( 14.4 per 100,000).

The Healthy People 2030 national target is to reduce the age-adjusted suicide death rate to 12.8 suicides per 100,000 population. While the data below is reported in the crude rate, any reduction in these numbers is progress towards a healthier community, and there has been a decrease in Palm Beach County from 2016 to 2020.

Table 135: Crude Suicide Death Rate, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

## Calls to 211 Related to Suicide

211 is a community helpline and crisis hotline that provides suicide prevention, crisis intervention, information, assessment, and referral to community services for people of all ages. ${ }^{130}$ The table below shows the number of calls to 211 related to suicide in Palm Beach County. In 2021, there were 19,917 mental health or substance use related calls to 211 in Palm Beach County. Of these, 604 were suicide related calls. Mental health or substance use calls, including suicide calls, comprised $26.6 \%$ of all calls to 211 in Palm Beach County in 2021. ${ }^{131}$

## Self-Inflicted Injuries

## Non-Fatal Hospitalizations for Self-Inflicted Injuries Ages 12-18

Young adults are the most likely demographic to suffer from non-fatal hospitalizations due to self-inflicted injuries. ${ }^{132}$ Such behaviors are particularly important to monitor as self-inflicted injuries are a risk factor for suicide. The following table shows the non-fatal hospitalization rate per 100,000 population for self-harm injuries ages 12 to 18 in Palm Beach County and Florida from 2015 to 2019. For each year during this timeframe, the Palm Beach County rate was notably lower than the Florida rate. In both Palm Beach County and Florida, the rate decreased from 2017 to 2019. The lowest rate in Palm Beach County was 40.6 per 100,000 population in 2019.

The Healthy People 2030 national target is to reduce the rate of hospitalizations for non-fatal self-injury for individuals 10 years and older to 144.7 per 100,000 population. ${ }^{133}$ While this data only looks at ages 12 to 18 , any reduction in these numbers is progress towards a healthier community.

Table 137: Non-Fatal Hospitalizations for Self-Harm Injuries Ages 12-18, Palm Beach County and Florida, 2015-2019

## Non-Fatal Hospitalizations for Self-Inflicted Injuries, Ages 19-21

As mentioned above, non-fatal self-injuries among young adults are associated with suicide and suicidal ideation, so it is important to monitor non-fatal self-injury hospitalization rates. The table below shows the non-fatal hospitalization counts and rates for self-harm injuries ages 19 to 21 in Palm Beach County and Florida from 2015 to 2019. During this time frame, the Palm Beach County rate fluctuated, with the lowest rate of 36.3 per 100,000 population reported in 2015 and the highest of 77.3 per 100,000 population reported in 2019. Additionally, the Palm Beach County rate of 64.8 per 100,000 population in 2018 and 77.3 per 100,000 population in 2019 was higher than the Florida rate during each of those years.

The Healthy People 2030 national target is to reduce the rate of hospitalizations for non-fatal self-injury to 144.7 per 100,000 population. ${ }^{134}$ While this data only looks at ages 19 to 21 , any reduction in these numbers is progress towards a healthier community.

Table 138: Non-Fatal Hospitalizations for Self-Harm Injuries Ages 19-21, Palm Beach County and Florida, 2015-2019

[^103]
## Alcohol Consumption

## Adults Who Engage in Heavy or Binge Drinking

Heavy or binge drinking is associated with numerous health problems, including liver disease, high blood pressure, stroke, heart disease, and cancer. ${ }^{135}$ Heavy or binge drinking is also associated with car crashes, suicide, assault, and other violent crimes. Annually, excessive alcohol use is responsible for 95,000 deaths in the United States, including 1 in 10 total deaths among working-age adults. ${ }^{136}$ Future data may show increases in the proportion of individuals who engage in heavy or binge drinking, as international evidence suggests that alcohol consumption has increased during the COVID-19 pandemic. ${ }^{137}$

The table below shows the rate of adults who engage in heavy or binge drinking in Palm Beach County and Florida for the years 2010, 2013, 2016, and 2019. In Palm Beach County, the percentage increased from 2010 (14.8\%) to $2016(17.8 \%)$, followed by a drop to $15.9 \%$ in 2019. In 2019, the percentage of adults engaging in heavy or binge drinking in Palm Beach County was $2.1 \%$ below the Florida percentage of $18.0 \%$ (the highest percentage in the state of all years reported).

Healthy People 2030 has set a national target of $25.4 \%$ for the percentage of adults who engage in binge drinking in the past month. ${ }^{138}$ While this data indicates adults who engage in heavy or binge drinking overall, there has been a decrease from $17.8 \%$ in 2016 to $15.9 \%$ in 2019.

[^104]
## Percent of Middle School Students Who Have Used Alcohol in the Past 30 Days

Nationally, $10 \%$ of eighth graders have reported using alcohol in the past 30 days, a particularly concerning figure considering that underage drinking is associated with school, social, and legal problems. ${ }^{139}$ The following table shows the percentage of middle school students who have used alcohol in the past 30 days in Palm Beach County and Florida in 2010, 2012, 2014, and 2016. From 2010 to 2016, the percentage in Palm Beach County and Florida has steadily decreased. The percentage dropped from $19.1 \%$ in 2010 to $9.2 \%$ in 2016 in Palm Beach County, and from $16.8 \%$ in 2010 to $8.3 \%$ in 2016 in Florida. Throughout this time period, the percentage of middle school students who had used alcohol in the past 30 days in Palm Beach County was slightly higher than the percentage statewide.

The Healthy People 2030 national target is to reduce the percentage of adolescents who have used alcohol in the past month to $6.3 \%{ }^{140}$ As of 2016, Palm Beach County had not yet met this target among middle school students.

Table 140: Percent of Middle School Students Who Have Used Alcohol in the Past 30 Days, Palm Beach County and Florida, 2010, 2012, 2014, 2016

## Percent of Middle School Students Who Report Binge Drinking

The table below shows the percentage of middle school students who reported binge drinking in the past two weeks in Palm Beach County and Florida in 2010, 2012, 2014, and 2016. Binge drinking is defined as having five or more alcoholic drinks in a row. ${ }^{141}$ In Palm Beach County and Florida, rates of binge drinking among middle school students dropped between 2010 and 2016. The rate in Palm Beach County decreased from $6.6 \%$ in 2010 to $3.3 \%$ in 2016, while the Florida rate decreased from 6.9\% in 2010 to $3.2 \%$ in 2019.

The Healthy People 2030 national target is to reduce the proportion of people under age 21 who have engaged in binge drinking in the past month to $8.4 \% .{ }^{142}$ While the data below only indicates the percentage of middle school students who reported binge drinking, any reduction in these numbers is progress towards a healthier community.

## Percent of High School Students Who Have Used Alcohol in the Past 30 Days

High schoolers who drink alcohol are more likely to report higher levels of absenteeism, in addition to social, legal, and health problems. ${ }^{143}$ The table below shows the percentage of high school students who have used alcohol in the past 30 days in Palm Beach County and Florida in 2010, 2012, 2014, and 2016. From 2010 to 2016, the rate in Palm Beach County decreased $14.8 \%$, dropping from $41.8 \%$ in 2010 to $27.0 \%$ in 2016. During the same time period, the rate in Florida decreased $2.5 \%$, dropping from $38.0 \%$ in 2010 to $35.5 \%$ in 2016. Most recently in 2016, the rate of high school students who reported using alcohol in the past 30 days in Palm Beach County (27.0\%) was $8.5 \%$ lower than the rate in Florida ( $35.5 \%$ ).

The Healthy People 2030 national target is to reduce the percentage of adolescents who have used alcohol in the past month to $6.3 \% .{ }^{144}$ While the below data is only among high school students, the proportion has consistently exceeded the target.

Table 142: Percent of High School Students Who Have Used Alcohol in the Past 30 Days, Palm Beach County and Florida, 2010, 2012, 2014, 2016

| Year | Palm Beach County | Florida |

## Percent of High School Students Who Report Binge Drinking

As previously mentioned, binge drinking is a public health issue that is particularly consequential for those under age 21. This table shows the percentage of high school students who reported binge drinking in the past two weeks in Palm Beach County and Florida in 2010, 2012, 2014, and 2016. Binge drinking is defined as having five or more alcoholic drinks in a row. ${ }^{145}$ The rate in Palm Beach County decreased by $11.2 \%$, dropping from $21.0 \%$ in 2010 to $9.8 \%$ in 2016. The rate in Florida decreased by $8.7 \%$, dropping from $19.6 \%$ in 2010 to $10.9 \%$ in 2016. Most recently in 2016, the percentage of high school students who reported binge drinking in Palm Beach County ( $9.8 \%$ ) was $0.8 \%$ below the state percentage (10.9\%).

The Healthy People 2030 national target is to reduce the proportion of people under age 21 who have engaged in binge drinking in the past month to $8.4 \%$. While the data below indicates only the percentage of high school students who reported binge drinking, there has been a decrease from 2014 to 2016.
Table 143: Percent of High School Students Who Report Binge Drinking, Palm Beach County and Florida, 2010, 2012, 2014, 2016

## Tobacco

## Adults Who Are Current Smokers

Smoking leads to a wide variety of diseases and disabilities and is known to cause harm to nearly every organ in the body. ${ }^{146}$ Over 16 million Americans are living with a disease caused by smoking. Importantly, for every person who has died of smoking, at least thirty people live with a smoking-related health complication.

The table below shows the percentage of adults who were current smokers in Palm Beach County and Florida in 2010, 2013, 2016, and 2019. Each year reported, except 2016, Palm Beach County had a lower percentage of adult smokers compared to Florida. From 2016 to 2019, the rate in Palm Beach County decreased from 16.3\% to 11.0\%. The rate of $11.0 \%$ in 2019 for the county was lower than the Florida rate of $14.8 \%$.

The Healthy People 2030 national target is to reduce the percentage of all individuals over 18 years old being current cigarette smokers to $5.0 \%$. ${ }^{147}$ As of 2019, Palm Beach County has not yet meeting this target.

Table 144: Adults Who Are Current Smokers, Palm Beach County and Florida, 2010, 2013, 2016, 2019

## Percent of Adults Who Are Current E-Cigarette Users

In 2018, 3.2\% of adults in the United States were current e-cigarette users, and 15\% of adults had reported using an electronic cigarette, or e-cigarette, at one point. ${ }^{148}$ While the long-term health risks of e-cigarettes are not yet fully understood, there is compelling evidence to suggest that e-cigarettes may contribute lung injury. In addition, the high levels of nicotine in e-cigarettes make them incredibly addicting.

The following table shows the percentage of adults who were current e-cigarette users in Palm Beach County and Florida in 2016 and 2019. This percentage decreased for Palm Beach County from $6.4 \%$ in 2016 to $5.4 \%$ in 2019. Florida, however, reported an increase from 4.7\% in 2016 to 7.5\% in 2019.

Healthy People 2030 has not set a national target for the percentage of adults who are current e-cigarette users.
Table 145: Percent of Adults Who Are Current E-cigarette Users, Palm Beach County and Florida, 2016 and 2019

## High School Students Smoking Cigarettes in The Past 30 Days

The table below shows the percentage of high school students who smoked cigarettes in the past 30 days in Palm Beach County and Florida in 2014, 2016, 2018, and 2020. From 2014 to 2020, Palm Beach County and Florida both reported sharp declines in the proportion of high school students who smoke cigarettes. In 2020, 4.6\% of high school students nationally reported smoking cigarettes in the past 30 days. ${ }^{149}$ Palm Beach County (2.0\%) and Florida (2.3\%) reported their lowest proportions that same year. For each year reported, the proportion of high school students smoking cigarettes in Palm Beach County was lower than the Florida rate.

The Healthy People 2030 national target is to reduce the proportion of adolescents who had used cigarettes in the past 30 days to $3.4 \% .{ }^{150}$ While this data only looks at high school students, there is a recent decrease from $2.7 \%$ in 2018 to $2 \%$ in 2020.

Table 146: High School Students Smoking Cigarettes in The Past 30 Days, Palm Beach County and Florida, 2014, 2016, 2018, 2020

| Year | Palm Beach County | Florida |  |

## Middle School Students Smoking Cigarettes in The Past 30 Days

In 2020, 1.5\% of middle schoolers nationally reported smoking cigarettes in the past 30 days. ${ }^{151}$ The table below shows the percentage of middle school students who had smoked cigarettes in the past 30 days in Palm Beach County and Florida in 2014, 2016, 2018, and 2020. From 2014 to 2018, the percentage in Palm Beach County declined from $2.5 \%$ to $0.6 \%$, then increased from $0.6 \%$ in 2018 to $0.9 \%$ in 2019. Additionally, the percentage of middle school students who had smoked a cigarette in the past 30 days in Palm Beach County was lower than the Florida percentage every year reported, except 2014.

The Healthy People 2030 national target is to reduce the proportion of adolescents who had used cigarettes in the past 30 days to $3.4 \%$. ${ }^{152}$ While this data only looks at middle school students, the proportion has decreased overall from $2.5 \%$ in 2014 to $0.9 \%$ in 2020.

Table 147: Middle School Students Smoking Cigarettes in The Past 30 Days, Palm Beach County and Florida, 2014, 2016, 2018, 2020

## Opioid Use

## Opioid Prescriptions

As of 2016, the Centers for Disease Control and Prevention issued updated guidelines for prescribing opioids for chronic pain in response to the opioid epidemic in years prior. Chronic opioid therapy has affected millions of Americans, sometimes leading to addictive behavior and an increased risk of overdose. As opioids became increasingly available through liberal prescriptions, the United States saw a sharp increase in heroin use and drug overdose deaths, which increased $137 \%$ between 2000 and 2014. In the same time period, overdoses involving prescription opioids and heroin increased $200 \%{ }^{153}$ Importantly, there is an increased risk for COVID-19 among patients on high-dose opioids and those with opioid use disorder. ${ }^{154}$

In Palm Beach County, counts of prescriptions dispensed and unique patients receiving opioid prescriptions steadily decreased between 2016 and 2020. Counts of unique prescribers in Palm Beach County over the same time period fluctuated, with a slight increase in 2017 ( 13,132 unique prescribers) and 2020 ( 14,800 unique prescribers). The count of unique prescribers reached a five-year high in 2020.

There is no Healthy People 2030 national target directly related to opioid prescriptions; however, there is a national target to reduce the proportion of people who misused prescription opioids in the past year to $3.3 \%$. ${ }^{155}$

Table 148: Opioid Prescriptions, Palm Beach County, 2016-2020

|  | Palm Beach County |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  | 2016 | 2017 | 2018 | 2019 | 2020 |
| Prescription Dispensed | 963,730 | 917,106 | 837,516 | 789,409 | 797,215 |
| Unique Patients | 268,188 | 254,684 | 226,831 | 205,607 | 206,345 |

[^112]
## Opioid-Related Non-Fatal Emergency Department Visits

Studies have shown that frequent emergency department visits for opioid overdose are associated with an increased likelihood of future hospitalizations and near-fatal events from opioid misuse. In one study, $53 \%$ of emergency department visits for opioid overdose resulted in hospitalization and $10.0 \%$ of emergency department visits for opioid overdose led to a near-fatal event. ${ }^{156}$

In Palm Beach County, opioid-related non-fatal emergency department visits decreased between 2017 (3,176 nonfatal emergency department visits) and 2020 (1,768 non-fatal emergency department visits). The state of Florida reported an initial decrease in visits between $2017(18,379)$ and $2018(14,396)$, but visits subsequently increased over the next two years, reaching 21,277 opioid-related non-fatal emergency department visits in the state in 2020 .

While there is no current Healthy People 2030 national target directly related to opioid-related emergency department visits for all populations, an objective to reduce the rate of opioid-related emergency department visits is in the developmental stages. This highlights opioid-related emergency department visits as a high-priority public health issue that has evidence-based interventions available. Once baseline data becomes available for this objective on the national level, it will be considered to become a core Healthy People 2030 objective.

[^113]
## Opioid-Related Non-Fatal Overdose Hospitalizations

It is estimated that approximately 7,000 people are treated in emergency departments for opioid misuse each day in the United States. According to research, mortality rates among opioid-related hospitalizations have increased more than fourfold in recent years compared to general decreasing mortality rates among all other hospitalizations in the country. ${ }^{157}$

Opioid-related non-fatal overdose hospitalizations in Palm Beach County reached a five-year peak in 2017, with 710 hospitalizations recorded. Hospitalization counts subsequently decreased until 2020, when there were 606 opioidrelated non-fatal hospitalizations in Palm Beach County. The state of Florida saw a similar fluctuating trend, with 9,165 non-fatal hospitalizations reported in 2016 and 8,185 non-fatal hospitalizations reported in 2020.

There is no Healthy People 2030 national target directly related to opioid-related non-fatal hospitalizations.
Table 150: Opioid-Related Non-Fatal Overdose Hospitalizations, Palm Beach County and Florida, 2016-2020

[^114]
## Age-Adjusted Opioid Deaths, Per 100,000 Population

According to the Centers for Disease Control and Prevention, the number of drug overdose deaths has quadrupled between 1999 and 2019. The United States reported a nearly 5\% increase in drug overdose deaths from 2018 to 2019 alone. In this same time period, opioid-involved death rates increased by over 6\% nationally. Prescription opioid-involved death rates decreased by nearly $7 \%$. Synthetic opioid-involved death rates (excluding methadone) increased by over $15 \%$. Overall, it is estimated that 136 people die each day from an opioid overdose, including both prescription and illicit opioids. ${ }^{158}$

In Palm Beach County, the rate of age-adjusted opioid deaths decreased from 2017 ( 51.0 deaths per 100,000 population) to 2018 ( 30.9 deaths per 100,000 population). A subsequent increase was seen between 2018 and 2020, reaching 47.1 deaths per 100,000 population. Palm Beach County reported higher rates than the state of Florida overall between 2016 and 2020.

The Healthy People 2030 national target is to reduce overdose deaths involving opioids from 14.6 deaths per 100,000 population to 13.1 deaths per 100,000 population. ${ }^{159} \mathrm{As}$ of 2020, Palm Beach County is not yet meeting this target.

Table 151: Age-Adjusted Opioid Deaths, Per 100,000 Population. Palm Beach County and Florida, 2016-2020

[^115]
## Adults Who Used Marijuana or Hashish During the Past 30 Days

Marijuana is the most commonly used illegal drug in the United States with nearly a fifth of all Americans reporting to have used it at least once. ${ }^{160}$ Approximately $30 \%$ of marijuana users have marijuana use disorder, or an unhealthy dependence on the substance. Importantly, however, research suggests that cannabis helps treat rare forms of epilepsy, cancer treatment-related nausea and vomiting, chronic pain, and loss of appetite due to HIVIAIDS. ${ }^{161}$ The table below shows the percentage of adults who had used marijuana or hashish during the past 30 days in Palm Beach County and Florida in 2016. During this year, the percentage of adults in Palm Beach County who used marijuana or hashish during the past 30 days was $5.7 \%$ (which was $1.7 \%$ lower than the Florida rate).

The Healthy People 2030 national target is to reduce the percentage of adults who use marijuana daily or almost daily to $3.4 \%{ }^{162}$ Palm Beach County is not yet meeting this target.

Table 152: Adults Who Used Marijuana or Hashish During the Past 30 Days, Palm Beach County and Florida, 2016

## Middle School Students Who Used Marijuana or Hashish During the Past 30 Days

As mentioned above, the negative health impacts from marijuana use are greater for those under the age of 18. The table below shows the percentage of middle school students who used marijuana or hashish during the past 30 days in Palm Beach County and Florida in 2010, 2012, 2014, and 2016. While the Palm Beach County rate fluctuated from year to year, it decreased from $4.1 \%$ in 2014 to $2.4 \%$ in 2016. The Florida rate gradually decreased from $5.7 \%$ in 2010 to $3.2 \%$ in 2016.

The Healthy People 2030 national target is to reduce the percentage of adolescents who have used marijuana in the past 30 days to $5.8 \%$. ${ }^{163}$ While the data below only looks at middle school students, any reduction in these numbers is progress towards a healthier community.

Table 153: Middle School Students Who Used Marijuana or Hashish During the Past 30 Days, Palm Beach County and Florida, 2010, 2012, 2014, 2016

[^116]
## High School Students Who Used Marijuana or Hashish During the Past 30 Days

The risk of developing marijuana use disorder is greater among those under age 18 than among adults. ${ }^{164}$ The effects of marijuana use on the brain are especially profound for infants, children, and teens whose brains are still developing.

The table below shows the percentage of high school students who had used marijuana or hashish during the past 30 days in Palm Beach County and Florida in 2010, 2012, 2014, and 2016. Palm Beach County reported a higher rate than Florida every year, except 2016. Both the Palm Beach County rate and the Florida rate dropped from 2014 to 2016. In Palm Beach County, the rate of high school students who used marijuana or hashish during the past 30 days decreased from $22.6 \%$ to $15.4 \%$ in that time frame.

The Healthy People 2030 national target is to reduce the percentage of adolescents who have used marijuana in the past 30 days to $5.8 \%$. ${ }^{165}$ While the data below only looks at high school students, any reduction in these numbers is progress towards a healthier community.

Table 154: High School Students Who Used Marijuana or Hashish During the Past 30 Days, Palm Beach County and Florida, 2010, 2012, 2014, 2016

| Year | Palm Beach County | Florida |  |
| :---: | ---: | ---: | :---: |
| 2010 | $22.7 \%$ | $18.6 \%$ |  |
| 2012 | $20.6 \%$ | $18.5 \%$ |  |

[^117]
## Eating Disorders

There are estimates that upwards of 30 million people have an eating disorder in the United States, and $95 \%$ of people suffering from eating disorders are between the ages of 12 and 25 . ${ }^{166}$ The most common eating disorders include anorexia nervosa, bulimia nervosa, binge eating disorder, avoidant restrictive food intake disorder, and other specified feeding or eating disorder. It is possible that future data will demonstrate increases in the prevalence of eating disorders and related complications, as evidence shows that there has been a substantial increase in both the number of individuals suffering from and the severity of eating disorders during the COVID-19 pandemic. 167

## Non-Fatal Hospitalizations for Eating Disorders Ages 12-18

The following table shows the non-fatal hospitalizations for individuals with eating disorders ages 12 to 18 in Palm Beach County and Florida from 2015 to 2019. During this time frame, rates in Palm Beach County have fluctuated, with a low of 19.2 per 100,000 population in 2015 and a high of 35.5 per 100,000 population in 2016. In 2019, Palm Beach County reported a rate of 29.1 per 100,000 population, which was an increase from the 2018 rate of 26.7 per 100,000 population. During every year reported, the Palm Beach County rate was lower than the Florida rate.

Healthy People 2030 has not identified a national target related to eating disorders.
Table 155: Non-Fatal Hospitalizations for Eating Disorders Ages 12-18, Palm Beach County and Florida, 2015-2019

[^118]
## Morbidity

Overweight and Obesity

According to the World Health Organization, being overweight or obese is defined as having abnormal or excessive fat accumulation that impairs health. Both are complex, chronic health issues that are largely preventable through lifestyle modifications and are impacted by a number of behavioral, social, environmental, and even genetic factors. Body mass index (BMI) is a screening tool used to classify overweight and obesity status by using a person's weight and height. For adults, a BMI of 25 to 29 is categorized as overweight and 30 or higher is obese. ${ }^{168}$ Importantly, being overweight or obese is a risk factor for other serious mental and physical health issues, including COVID-19. ${ }^{169}$ Additionally, the pandemic could have exacerbated the issue, as more individuals socially isolated and increases in sedentary lifestyles were observed.

Childhood overweight and obesity is also a significant issue today, particularly because children who are overweight or obese are more likely to be overweight or obese as adults and have symptoms as adults that are more severe. These symptoms include, but are not limited to, high blood pressure, high cholesterol, insulin resistance, breathing problems, joint problems, anxiety, and depression. ${ }^{170}$ According to the Centers for Disease Control and Prevention, one in five children and adolescents are obese nationwide. ${ }^{171}$

The Healthy People 2030 national target specific to adults is to reduce the proportion of adults with obesity ages 20 and over to $36.0 \%$. ${ }^{172}$ The Healthy People 2030 national target specific to children is to reduce the proportion of children and adolescents ages 2 to 19 years old with obesity to $15.5 \% .{ }^{173}$

[^119]
## Percent of Middle School Students with BMI at or Above 95th Percentile

The table below shows the percent of middle school students with a BMI at or above the $95^{\text {th }}$ percentile in Palm Beach County and Florida for 2012, 2014, 2016, 2018, and 2020. In Palm Beach County public schools, there was a steady increase from 2016 ( $11.3 \%$ ) to 2020 ( $13.0 \%$ ).

Table 156: Percent of Middle School Students with BMI at or Above 95th Percentile, Palm Beach County and Florida, 2012, 2014, 2016, 2018, 2020

## Percent of High School Students with BMI at or Above 95th Percentile

The following table shows the percent of high school students with a BMI at or above the $95^{\text {th }}$ percentile in Palm Beach County and Florida in 2012, 2014, 2016, 2018, and 2020. In Palm Beach County, the percentage declined from $2014(12.0 \%)$ to 2016 ( $9.5 \%$ ), then increased in $2018(12.4 \%)$ and 2020 (12.8\%). Additionally, the percentage of Palm Beach County high school students with a BMI at or above the $95^{\text {th }}$ percentile was lower than percentage of Florida high school students overall each year reported.

Table 157: Percent of High School Students with BMI at or Above 95th Percentile, Palm Beach County and Florida, 2012, 2014, 2016, 2018, 2020

## Percent of Middle and High School Students with BMI at or Above 95th Percentile, By Race and Ethnicity

The table and graph below show the percentage of middle and high school students with a BMI at or above the $95^{\text {th }}$ percentile by race in 2012, 2014, 2016, 2018, and 2020. For each year reported, Non-Hispanic Black and Hispanic students had much higher rates than Non-Hispanic Whites in Palm Beach County and Florida. The rates for NonHispanic White and Non-Hispanic Black students increased in 2016, 2018, and 2020. The highest rate for the county was found among Non-Hispanic Black students in 2020 at 17.2\%.

Table 158: Percent of Middle and High School Students with BMI at or Above 95th Percentile, By Race and Ethnicity, Palm Beach County and Florida, 2010, 2012, 2014,2016, 2018, 2020

## Underweight, Healthy Weight, Overweight, and Obese Students in First, Third, and Sixth Grades

This table and graph show Palm Beach County students in first, third, and sixth grades that were underweight, a healthy weight, and overweight or obese during the 2020-2021 school year. As the grade increased, the percentage of overweight or obese students increased and the percentage of healthy weight students decreased. Most notably, the percentage of sixth graders who were overweight or obese was close to half of the entire grade at 46.0\%.

Table 159: Underweight, Healthy Weight, and Overweight or Obese Students in First, Third, and Sixth Grades, Palm Beach County, School Year 2020-2021

| Grade | Underweight |  | Healthy Weight |  | Overweight or Obese |  |

## Overweight or Obese First and Third Graders in Palm Beach County, By School

The table below shows the number of overweight or obese students in first, third and sixth grades in Palm Beach County during the 2021-2021 school year. As a note, many students were not screened during the 2020-2021 school year due to the COVID-19 pandemic which resulted in a virtual learning environment. Some schools with counts included in the table below offered virtual students the opportunity to be screened on campus, but screenings were voluntary. Additionally, this data was collected from the Health Care District of Palm Beach County, whereas the previously displayed data was collected from the Florida Department of Health in Palm Beach County.

## Percent of Adults who are Overweight

The following table and graph show the percentage of adults who were overweight in Palm Beach County and Florida in 2007, 2010, 2013, 2016 and 2019. While the percentage of overweight adults in Palm Beach County declined each year reported from 2007 to 2016, there was an increase from 2016 (32.1\%) to 2019 (35.2\%).

Table 161: Percent of Adults Who Are Overweight, Palm Beach County and Florida, 2007, 2010, 2013, 2016, 2019

| Year | Palm Beach County | Florida |

## Percent of Adults who are Overweight, By Race and Ethnicity

This table and graph show the percentage of adults who were overweight by race and ethnicity in Palm Beach County and Florida in 2007, 2010, 2013, 2016 and 2019. The percentage of adults of all races in Palm Beach County and Florida fluctuated from 2007 to 2019. In 2019, Non-Hispanic Black adults had the highest rate in Palm Beach County at $46.7 \%$, which was much higher than the Florida rate of $35.1 \%$.

Table 162: Percent of Adults Who Are Overweight, By Race and Ethnicity, Palm Beach County and Florida, 2007, 2010, 2013, 2016, 2019

[^122]
## Percent of Adults Who Are Obese

The table below shows the percentage of adults who were obese in Palm Beach County and Florida in 2007, 2010, 2013, and 2016. The percentage of Palm Beach County adults increased steadily from 2007 to 2019. In 2019, almost a quarter ( $24.3 \%$ ) of all reported adults were obese in Palm Beach County. This was slightly below the state rate of 27.0\%.

As previously mentioned, the Healthy People 2030 national target is to reduce the proportion of adults ages 20 and over with obesity to $36.0 \%$. ${ }^{174}$ This table below shows the percentage of obese adults ages 18 and over. Palm Beach County reported rates that were below the $36.0 \%$ threshold each year reported.
Table 163: Percent of Adults Who Are Obese, Palm Beach County and Florida, 2007, 2010, 2013, 2016, 2019

## Percent of Adults who are Obese, By Race and Ethnicity

The following table and graph show the percentage of adults who were obese in 2007, 2010, 2013, 2016, and 2019 in Palm Beach County and Florida by race and ethnicity. Rates fluctuated for all races in Palm Beach County across all years. In 2019, Non-Hispanic Black adults ( $28.1 \%$ ) and Hispanic adults (28.0\%) had much higher rates of obesity than Non-Hispanic White adults (22.4\%) in Palm Beach County. However, the Palm Beach County rates were slightly lower than the Florida rates for all races in 2019.

Table 164: Percent of Adults Who Are Obese, By Race and Ethnicity, Palm Beach County and Florida, 2007, 2010, 2013, 2016, 2019

## Hypertension

Hypertension is defined by the American College of Cardiology and the American Heart Association as a blood pressure that is at or above 130 over 60 millimeters of mercury ( mm Hg ). Having hypertension puts individuals at risk for heart disease and stroke, which is the leading cause of death in the United States. ${ }^{175}$

Certain factors can put an individual at an increased risk of hypertension, including certain health conditions, lifestyle behaviors, and family history of hypertension. The risk of hypertension also increases with age, because blood pressure tends to rise as an individual gets older. In addition to age, other risk factors include sex, race, and ethnicity. When looking at different groups that are most at risk for hypertension, women are more likely to develop hypertension than men. Black individuals develop hypertension earlier in life than White individuals, and Black individuals are more likely to develop hypertension than other racial groups, as well as Hispanic individuals. ${ }^{176}$

Additionally, the recent COVID-19 pandemic could have affected the prevalence of hypertension, because of an increase in risk factors such as stress and anxiety from financial hardship, physical isolation, and an increase in alcohol consumption and other substances used as coping mechanisms. Additionally, it was reported that 4 of 10 patients were delaying medical care due to concerns related to COVID-19 in 2020, which can result in an increase in morbidity and mortality. ${ }^{177}$

## Preventable Hospitalizations Under 65 from Hypertension

The table and figure below show the rate of preventable hospitalizations due to hypertension per 100,000 population for Palm Beach County and Florida from 2015 to 2019. During this timeframe, this rate per 100,000 population significantly decreased in Palm Beach County (from 37.7 in 2015 to 4.7 in 2019) and the state overall (from 37.2 in 2015 to 4.0 in 2019). However, it is important to note that increases or decreases starting in 2015 may not be caused by changes in disease trends but rather due to changes in coding following the transition from the ICD 9th Revision Clinical Modification to the ICD 10th Revision Clinical Modification.

While there is no Healthy People 2030 target related to hypertension-related hospitalizations, there is a national target to reduce the proportion of adults with high blood pressure to $27.7 \%$. ${ }^{178}$

## Adults Who Have Ever Been Told They Had Hypertension

The table and figure below show the percentage of adults who had ever been told they had hypertension in Palm Beach County and Florida in 2010, 2013, and 2019. In Palm Beach County and the state overall, the percentage increased from 2010 to 2013, then decreased slightly to 2019. In 2019, the percentage of adults who had ever been told they had hypertension was $33.8 \%$ in Palm Beach County and $33.5 \%$ in Florida.

The Healthy People 2030 national target is to reduce the proportion of adults with high blood pressure to $27.7 \%{ }^{179}$ As of 2019, 33.8\% adults in Palm Beach County had ever been told they had hypertension, which exceeded the target.

[^125][^126]
## Coronary Heart Disease

Heart disease refers to various conditions that affect the health of the heart. Key risk factors for heart disease include high blood pressure, high cholesterol, excessive alcohol use and smoking, as well as contributing factors such as diet and physical activity. Heart disease cost the United States approximately $\$ 219$ billion in 2014 and 2015, which included the cost of health care services, medicines, and lost productivity due to death. ${ }^{180}$ The COVID-19 pandemic could have caused an increase in the prevalence of coronary heart disease, because of stress and anxiety from financial hardship, job loss, and physical isolation. Additionally, it was reported that 4 of 10 patients were delaying medical care due to concerns related to COVID-19 in 2020, which can result in an increase in morbidity and mortality. ${ }^{181}$

## Age-Adjusted Hospitalization from or With Coronary Heart Disease

Coronary heart disease is a type of heart disease that develops when the arteries of the heart cannot deliver enough oxygen-rich blood to the heart. Coronary heart disease is the leading cause of death in the United States. ${ }^{182}$ The rate of hospitalizations from or with coronary heart disease per 100,000 population in Florida and Palm Beach County from 2015 to 2019 is shown in the table and figure below. In Palm Beach County from 2015 to 2019, the coronary heart disease hospitalization rate decreased from 237.9 per 100,000 to 215.6 per 100,000, respectively. This declining trend for the county mirrors a similar trend at the state level.

While there is no Healthy People 2030 national target specific to reducing the coronary heart disease hospitalization rate, there is a national target to reduce coronary heart disease deaths to 71.1 per 100,000 population. ${ }^{183}$

Table 167: Age-Adjusted Hospitalization from or With Coronary Heart Disease, Rate Per 100,000 Population, Palm Beach County and Florida, 2015-2019

| Year | Palm Beach County |  | Florida |  |

## Age-Adjusted Hospitalization from or with Coronary Heart Disease, By Race

Research shows that the incidence of coronary heart disease is declining in the United States. However, the rate of decline for Black Americans has lagged in comparison to White Americans. ${ }^{184}$ The table and figure below show the rate of hospitalizations from or with coronary heart disease by race per 100,000 population. The coronary heart disease rates among Black and White residents decreased overall from 2015 to 2019. However, Black residents consistently had a hospitalization rate higher than White residents during this timeframe. In 2019, the rate among Palm Beach County Black residents was 230.3 per 100,000 population, while the rate among Palm Beach County White residents was 190.4 per 100,000 population.

[^128]
## Age-Adjusted Hospitalization from or with Coronary Heart Disease, By Ethnicity

The table and figure below show the rate of hospitalizations from or with coronary heart disease by ethnicity per 100,000 population in Palm Beach County and Florida from 2015 to 2019. During this time frame, the rate of hospitalization decreased overall among Hispanics and non-Hispanics in Palm Beach County and Florida. However, the coronary heart disease rate was higher among non-Hispanics compared to Hispanics every year reported. Most recently in 2019, the hospitalization rate was 215.8 per 100,000 population among Palm Beach County nonHispanics and 192.1 per 100,000 among Palm Beach County Hispanics.

Table 169: Age-Adjusted Hospitalization From or With Coronary Heart Disease, Rate Per 100,000 Population, By Ethnicity, Palm Beach County and Florida, 2015-2019

## Adults Who Have Ever Been Told They Had Angina or Coronary Heart Disease

Angina is a type of chest pain caused by reduced blood flow to the heart. The most common cause of reduced blood flow to your heart is coronary heart disease, which occurs when your coronary arteries become narrowed by fatty deposits called plaques. ${ }^{185}$

The table and figure below show the percentage of adults who have ever been told they had angina or coronary heart disease in Palm Beach and Florida in 2013, 2016, and 2019. The percentage of adults who have ever been told they had angina or coronary heart disease declined from $2013(6.3 \%)$ to $2019(5.0 \%)$ in Palm Beach County. However, the percentage of adults in Palm Beach County was higher than Florida each year reported.

There is no Healthy People 2030 national target specific to the percent of adults who have ever been told they had angina or coronary heart disease.

Table 170: Adults Who Have Ever Been Told They Had Angina or Coronary Heart Disease, Palm Beach County and Florida, 2013-2019

[^130]
## Adults Who Have Ever Been Told They Had Angina or Coronary Heart Disease, By Race and Ethnicity

As previously mentioned, it is important to look at coronary heart disease incidence rates by race and ethnicity to identify disparities. The table and figure below show the percent of adults who have ever been told they had angina or coronary heart disease by race and ethnicity in Palm Beach County and Florida in 2013, 2016, and 2019. In Palm Beach County, the percentage of adults ever told that they had angina or coronary heart disease steadily declined from 2013 to 2019 among non-Hispanic Whites. The percentage of non-Hispanic Black adults in Palm Beach County increased from $2013(3.2 \%)$ to 2016 ( $7.4 \%$ ), then declined in 2019 ( $5.2 \%$ ). The percentage of Hispanic adults in Palm Beach County declined sharply from $2013(6.7 \%)$ to $2016(0.1 \%)$ and increased slightly in $2019(0.6 \%)$. In 2019, this percentage was highest among non-Hispanic Whites ( $6.9 \%$ ) compared to non-Hispanic Black ( $5.2 \%$ ) and Hispanics $(0.6 \%)$. This trend for the county was similar to the trend in the state.

Table 171: Adults Who Have Ever Been Told They Had Angina or Coronary Heart Disease, By Race and Ethnicity, Palm Beach County and Florida, 2013-2019

## Congestive Heart Failure

## Age-Adjusted Hospitalizations from Congestive Heart Failure

Heart failure is a condition that develops when the heart doesn't pump enough blood and oxygen to support other organs in the body. This can happen if the heart can't fill up with enough blood. It can also happen when your heart is too weak to pump properly. Heart failure can develop suddenly or over time as your heart gets weaker. Common causes of heart failure include coronary heart disease, high blood pressure, and diabetes. ${ }^{186,187}$

The table and figure below show the age-adjusted hospitalization rates from congestive heart failure per 100,000 population for Palm Beach County and Florida from 2015 to 2019. During this time frame, the rate increased in Palm Beach County from 832.2 per 100,000 population in 2015 to 960.9 per 100,000 population in 2019. Each year reported, the Palm Beach County rate was lower than the state rate.

The Healthy People 2030 national target is to reduce the hospitalizations from heart failures to 355.2 per 100,000 population. ${ }^{188}$ In 2019, congestive heart failure hospitalization rates were nearly three times higher in Palm Beach County ( 960.9 per 100,000 ) than the national target. ${ }^{189}$

## Age-Adjusted Hospitalizations from Congestive Heart Failure, By Race

The table and figure below show the congestive heart failure hospitalization rate per 100,000 population by race for Palm Beach County and Florida from 2015 to 2019. From 2016 to 2019, congestive heart failure hospitalization rates steadily increased among White and Black residents in Palm Beach County. However, the rate among Black residents was much higher each year during this timeframe. In 2019, the hospitalization rate was more than double among Black residents ( $1,623.6$ per 100,000) compared to White residents ( 777.3 per 100,000) in Palm Beach County. Additionally, Palm Beach County White and Black rates were lower than the state rates each year reported.

Table 173: Age-Adjusted Hospitalizations from Congestive Heart Failure, Rate Per 100,000 Population, By Race, Palm Beach County and Florida, 2015-2019

## Age-Adjusted Hospitalizations from Congestive Heart Failure, By Ethnicity

The table and figure below show the age-adjusted hospitalization rate per 100,000 population by ethnicity for Palm Beach County and Florida from 2015 to 2019. The hospitalization rate increased overall among both the Hispanic and non-Hispanic populations in Palm Beach County during this timeframe. However, the rate was higher among the non-Hispanic population every year reported. In 2019 in Palm Beach County, the rate was 978.7 per 100,000 among non-Hispanic residents and 821.6 per 100,000 among Hispanics residents.

## Cancer

Cancer, also called malignant neoplasm, is a class of diseases in which a cell or a group of cells display uncontrolled growth (division beyond the normal limits), invasion (intrusion on and destruction of adjacent tissues), and sometimes metastasis (spread to other locations in the body). Normally, human cells grow and divide to form new cells as the body needs them. When cells grow old or become damaged, they die, and new cells take their place. ${ }^{190}$ However, when cancer develops, this process breaks down. As cells become more abnormal, old, or damaged, cells survive when they should die, and new cells form when they are not needed. These extra cells can divide without stopping and may form growths called tumors. Cancerous tumors are malignant, which means they can invade nearby tissues.

Complex and interrelated factors contribute to the risk of developing cancer and to the observed disparities in cancer incidence and death among racial, ethnic, and underserved groups. The most obvious factors are a lack of health care coverage and low socioeconomic status. ${ }^{191}$ Those who are living in poverty and are medically underserved may exhibit higher rates of behavioral risk factors for cancer, such as tobacco smoking, physical activity, obesity, and excessive alcohol intake, and lower rates of breastfeeding. ${ }^{192}$ Moreover, those who live in poverty may experience higher rates of exposure to environmental risk factors such as cancer-causing substances in motor vehicle exhaust in dense urban neighborhoods. In addition, even among people of a higher socioeconomic status, certain racial and ethnic groups may experience cancer disparities. These differences may reflect cultural differences such as distrust in the health care system, fatalistic attitudes about cancer, or apprehension or embarrassment about having certain kinds of medical procedures.

In addition, the recent COVID-19 pandemic could have impacted the prevalence of cancer, because, according to the Centers for Disease Control and Prevention, 4 of 10 patients were delaying medical care due to concerns related to COVID-19 in 2020. ${ }^{193}$ This could have resulted in delayed screening and detection of cancer for many patients, causing the cancer to progress further before any intervention and ultimately leading to an increase in morbidity and mortality.

[^134]
## Age-Adjusted Cancer Incidence

The table and figure below show the age-adjusted cancer incidence rate per 100,000 population in Palm Beach and Florida from 2014 to 2018. During this timeframe, this rate decreased from 426.1 per 100,000 in 2014 to 404.4 per 100,000 in 2018 in Palm Beach County. In 2018, the cancer incidence rate in Palm Beach County was 404.4 per 100,000 compared to 454.3 per 100,000 for the state overall.

There is no Healthy People 2030 national target specific to reducing cancer incidence rate.

## Age-Adjusted Cancer Incidence, By Race

According to the National Cancer Institute, in the United States overall cancer rates have remained higher among Black Americans compared to other racial groups. This disparity largely reflects a combination of multiple interconnected factors including tumor biology, stage at diagnosis, receipt of timely and effective treatment, and systemic discrimination in cancer care delivery. Black Americans and individuals of lower socioeconomic groups in general are also more likely to have a higher exposure to some cancer risk factors, including limited access to healthy food, safe places for physical activity, and evidence-based cancer preventive services. ${ }^{194}$

The table and figure below show the age-adjusted cancer incidence rate per 100,000 population by race for Palm Beach County and Florida from 2014 to 2018. During this timeframe, the cancer incidence rate decreased overall among White and Black residents in the county. However, the rate was higher among White residents than Black residents each year reported. In 2018, the rate was 405.2 per 100,000 among White residents in Palm Beach County and 326.4 per 100,000 among Black residents.

## Age-Adjusted Cancer Incidence, By Ethnicity

The table and figure below show the age-adjusted cancer incidence rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2014 to 2018. The rate fluctuated among Hispanics and non-Hispanics in Palm Beach County, and ultimately declined from 2016 to 2018 in both groups. The Hispanic and non-Hispanic rate in Palm Beach County was lower than the state rates each year reported. In 2018, the rate in Palm Beach County was 263.9 per 100,000 among the Hispanic population compared to 430.4 per 100,000 among the non-Hispanic population.

## Colorectal Cancer

Colorectal cancer starts in the colon or the rectum. These cancers can be called colon cancer or rectal cancer, depending on where they start. Colon cancer and rectal cancer are often grouped together because they have many common features. According to the 2020 Colorectal Cancer Statistics, colorectal cancer was the second most common cause of cancer death in the United States. It was estimated that in 2020, approximately 147,950 individuals would be diagnosed with colorectal cancer and 53,200 would die from the disease. This included 17,930 cases and 3,640 deaths among individuals ages younger than 50 years. The incidence rate between 2012 and 2016 ranged from 30 per 100,000 population in Asian/Pacific Islanders to 45.7 in Blacks and 89 in Alaska Natives. ${ }^{195}$

## Age-Adjusted Colorectal Cancer Incidence

The table and figure below show the colorectal cancer incidence rate per 100,000 population in Palm Beach County and Florida from 2014 to 2018. During this timeframe, the rate fluctuated but remained lower than the rate in the state. In 2018, the rate was 30.3 per 100,000 population in Palm Beach and 35.1 per 100,000 in the state.

Similar to the cancer incidence indicator, there is no Healthy People 2030 national target related to reducing colorectal cancer incidence.

## Age-Adjusted Colorectal Cancer Incidence, By Race

The table and figure below show the colorectal cancer incidence rate per 100,000 population by race in Palm Beach County and Florida from 2014 to 2018. During this time frame, the rate fluctuated among both White and Black residents in Palm Beach County. However, rates were slightly higher among Black residents each year reported. In 2018, the rate among Palm Beach County Black residents was 33.8 per 100,000 population compared to 28.7 per 100,000 population among Palm Beach County White residents.

## Age-Adjusted Colorectal Cancer Incidence, By Ethnicity

The table and figure below show the colorectal cancer incidence rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2014 to 2018. In Palm Beach County, the rate fluctuated among the Hispanic and non-Hispanic population. However, this rate was higher among the non-Hispanic population each year during this time frame. In 2018, the rate was 25.2 per 100,000 among the Palm Beach County Hispanic population compared to 31.5 per 100,000 among the non-Hispanic population.

## Breast Cancer

According to the Centers for Disease Control and Prevention, breast cancer is the second most common cancer among women in the United States. Deaths from breast cancer have declined over time. However, breast cancer remains the second leading cause of cancer death among women overall and the leading cause of cancer death among Hispanic women. ${ }^{196}$

Each year in the United States, approximately 255,000 cases of breast cancer are diagnosed in women and approximately 2,300 in men. Additionally, approximately 42,000 women and 500 men in the U.S. die each year from breast cancer. Black women have a higher breast cancer death rate than White women. ${ }^{197}$

## Age-Adjusted Breast Cancer Incidence

The table and figure below show the age-adjusted breast cancer incidence rate in Palm Beach County and Florida from 2014 to 2018. During this timeframe the rate fluctuated in Palm Beach County and Florida. However, the county rate was consistently higher than the state rate each year reported.

There is no Healthy People 2030 national target for reducing the breast cancer incidence rate.

## Age-Adjusted Breast Cancer Incidence, By Race

The table and figure below show the age-adjusted breast cancer incidence rate by race in Palm Beach County and Florida from 2014 to 2018. The breast cancer incidence rate was higher among White residents compared to Black residents in Palm Beach County each year during this time frame. In Palm Beach County in 2018, the rate was 126.9 per 100,000 among White residents compared to 106.3 per 100,000 among Black residents. The rate among White Palm Beach County residents was also higher than the rate among White Florida residents each year from 2014 to 2018.

Figure 93: Age-Adjusted Breast Cancer Incidence, Rate Per 100,000, By Race, Palm Beach County and Florida, 2014-2018

[^140]
## Age-Adjusted Breast Cancer Incidence, By Ethnicity

As previously mentioned, breast cancer is the leading cause of death among Hispanic women in the United States. The table and figure below show the age-adjusted breast cancer incidence rate by ethnicity for Palm Beach County and Florida from 2014 to 2018. The rate fluctuated among Hispanic and non-Hispanic residents in Palm Beach County throughout this time period, but ultimately increased from 74.1 per 100,000 in 2017 to 91.4 per 100,000 in 2018 among Hispanic residents and from 132.1 per 100,000 in 2017 to 136.0 per 100,000 in 2018 among nonHispanic residents. Additionally, the rate was much higher among the non-Hispanic residents each year from 2014 to 2018.

## Cervical Cancer

When cancer cells invade the cervix, it is called cervical cancer. All women are at risk for cervical cancer. However, it occurs most often in women over age 30. Cervical cancer used to be the leading cause of cancer death for women in the United States. However, in the past 40 years, the number of cases of cervical cancer and the number of deaths from cervical cancer have decreased significantly. This decline is largely the result of women getting regular Pap tests, which is a screening test that can detect pre-cancerous cells in the cervix. ${ }^{198}$ In 2018, the cervical cancer incidence rate among women in the United States was 7.5 per 100,000. When racial and ethnic disparities were examined, the rate was highest among Black women and Hispanic women with rates of 8.3 per 100,000 and 9.3 per 100,000, respectively. ${ }^{199}$

## Age-Adjusted Cervical Cancer Incidence

The table and figure below show the cervical cancer incidence rate per 100,000 female population in Palm Beach County and Florida from 2014 to 2018. During this timeframe, the rate in the county fluctuated and ultimately decreased from 8.4 per 100,000 in 2017 to 7.1 per 100,000 in 2018 . Additionally, the county rate was lower than the state rate each year from 2014 to 2018. In 2018, the rate in Palm Beach County was 7.1 per 100,000 compared to 8.6 per 100,000 in the state overall.

There is no Healthy People 2030 national target specific to reducing the cervical cancer incidence rate among females.

## Age-Adjusted Cervical Cancer Incidence, By Race

As mentioned above, the cervical cancer incidence rate has historically been higher among Black women compared to women of other races nationwide, so it is important to look at the incidence rate by race at the county and state level. The table and figure below show the cervical cancer incidence rate per 100,000 female population by race in Palm Beach County and Florida from 2014 to 2018. As seen below, the rate was higher among Black female residents in the county and state each year during this time frame. In 2018, the rate among Black female residents $(12.5$ per 100,000 ) in the county was over double the rate among White female residents ( 6.0 per 100,000 ).

## Prostate Cancer

Other than skin cancer, prostate cancer is the most common cancer among American men. The most common risk factor for prostate cancer is age. The older a man is, the greater the risk for prostate cancer. In addition, some men are at an increased risk for getting or dying from prostate cancer if they have a family history of prostate cancer or if they are Black American. Compared to other men, Black American men are more likely to get prostate cancer and are twice as likely to die from prostate cancer. 200

## Age-Adjusted Prostate Cancer Incidence

The following table and figure show the prostate cancer incidence rate per 100,000 male population in Palm Beach County and Florida from 2014 to 2018. During this timeframe, the rate in the county and Florida fluctuated. Most recently in Palm Beach County, the incidence rate decreased from 99.6 per 100,000 in 2017 to 76.4 per 100,000 in 2018. While the rate in Palm Beach County was higher than the state rate each year from 2014 to 2017, the county rate in 2018 of 76.4 per 100,000 was lower than the state rate of 89.1 per 100,000 .

There is no Healthy People 2030 national target specific to prostate cancer incidence rate in males.

## Age-Adjusted Prostate Cancer Incidence, By Race

The table and graph below look at the incidence rate of prostate cancer per 100,000 male population by race in Palm Beach County and Florida from 2014 to 2018. The incidence rate was higher among Black residents compared to White residents every year during this timeframe in Palm Beach County and Florida. Prostate cancer incidence rates decreased among Palm Beach County White residents from 89.3 per 100,000 in 2017 to 69.9 per 100,000 population in 2018 and among Black residents from 152.1 per 100,000 in 2017 to 92.5 per 100,000 in 2018.

## Age-Adjusted Prostate Cancer Incidence, By Ethnicity

This table and figure look at the prostate cancer incidence rate per 100,000 male population by ethnicity in Palm Beach County and Florida from 2014 to 2018. In Palm Beach County, the prostate cancer incidence rate decreased among the Hispanic population overall from 126.7 per 100,000 in 2014 to 68.0 per 100,000 in 2018. The rate among the Palm Beach County non-Hispanic population fluctuated during this time frame, but ultimately decreased from 101.0 per 100,000 population in 2016 to 77.9 per 100,000 in 2018. Additionally, the rate among the Hispanic population was higher in 2014 and 2015, while the rate among the non-Hispanic Population was higher from 2016 to 2018.

## Asthma

Asthma is a chronic lung disease that inflames and narrows the airways causing recurring attacks of symptoms, such as wheezing and coughing. Inflammation makes the airways sensitive to various allergens and irritants in the environment, including mold, dust mites, animal dander, pollen, diesel emissions, and tobacco smoke. This disease affects people of all ages but is one of the most common chronic diseases among children. ${ }^{201}$

## Age-Adjusted Emergency Room Visits Due to Asthma

The table and graph below show the rate of emergency room visits due to asthma per 100,000 population for Palm Beach County and Florida from 2015 to 2019. During this timeframe, this rate decreased from 560.0 per 100,000 in 2015 to 411.4 per 100,000 in 2019 in Palm Beach County. The Palm Beach County rate was lower than the state rate each year reported.

The Healthy People 2030 national target is to reduce the rate of emergency room visits due to asthma to 44 per 10,000 persons ages five and older living with asthma. ${ }^{202}$ While the data below shows the rate per 100,000 population, a rate was calculated for alignment with the national target. In 2019, Palm Beach County had met this target, with a rate of 36.2 per 10,000 population ages 5 and older.

## Age-Adjusted Emergency Room Visits Due to Asthma, By Race

The following table and graph show the rate of emergency room visits due to asthma per 100,000 population for Palm Beach County and Florida by race. Each year from 2015 to 2019, the rate of emergency room visits due to asthma among Black residents was at least three times higher than the rate among White residents in Palm Beach County. In 2019, the rate among Black residents was 827.6 per 100,000 compared to 224.0 per 100,000 among White residents. When comparing to statewide counterparts, Palm Beach County residents had lower rates for each year reported.

## Age-Adjusted Asthma Hospitalizations

The table and figure below show the age-adjusted rate of hospitalizations due to asthma per 100,000 population in Palm Beach County and Florida from 2015 to 2019. Over this time period, the rate steadily declined from 135.4 per 100,000 in 2015 to 74.4 per 100,000 in 2019 in Palm Beach County. However, the Palm Beach County rate was higher than the state rate each year reported.

There is no Healthy People 2030 national target specific to reducing the asthma hospitalization rate due to lack of baseline data. However, there is a Healthy People 2030 national objective to reduce hospitalizations due to asthma in people ages 5 to 64 years in general. ${ }^{203}$

## Age-Adjusted Asthma Hospitalizations, By Race

The table and figure below show the asthma hospitalization rate per 100,000 for Palm Beach County and Florida by race from 2015 to 2019. The rate declined among Palm Beach County White residents from 94.8 per 100,000 in 2015 to 40.3 per 100,000 in 2019 and among Black residents from 239.6 per 100,000 in 2015 to 150.0 per 100,000 in 2019. Every year from 2015 to 2019, the rate among Black residents in the county was higher rate than the rate among Black residents in the state. The hospitalization rate among Black residents in Palm Beach County was also much higher than the rate among White residents in the county each year reported. In 2019, the rate among Black residents ( 150.0 per 100,000 ) in the county was over three times higher than the rate among White residents ( 40.3 per 100,000$)$.

## Age-Adjusted Asthma Hospitalizations, By Ethnicity

The table and figure below show the rate of asthma hospitalizations per 100,000 population for Palm Beach County and Florida by ethnicity from 2015 to 2019. Over this time period, the rate declined steadily among both Hispanic and non-Hispanic residents in the county. In 2019, the rate in Palm Beach County was 69.8 per 100,000 among Hispanic residents compared to 79.3 per 100,000 among non-Hispanic residents. Additionally, the Palm Beach County rate for both groups was higher compared to the state rate every year from 2015 to 2019.

## Preventable Hospitalizations Among Population Under 65 from Asthma

The table and graph below show the rate of preventable hospitalizations due to asthma per 100,000 population under 65 years old in Palm Beach County and Florida from 2015 to 2019. During this timeframe, the rate decreased steadily in the county and the state overall. In 2019, this rate was 73.6 per 100,000 in Palm Beach County and 61.6 per 100,000 in Florida.

There is no Healthy People 2030 national target specific to preventable hospitalizations from asthma among populations under age 65.

## Stroke

There are two main types of strokes, ischemic and hemorrhagic. Ischemic strokes are caused by the blockage of a blood vessel. Hemorrhagic strokes are caused by a sudden bleeding in the brain. Both types of strokes can cause lasting brain damage, long-term disability, or death. An important aspect of treatment of stroke is time. The faster intervention is made, the less damage a stroke can cause. In recent years, the COVID-19 could have impacted the prevalence of stroke and stroke related disability, because patients were delaying care due to COVID-19 related concerns. Risk factors for stroke include lifestyle and behavior factors, such as diet, stress, and physical activity. The pandemic has had a major impact these factors, further contributing to the pandemic's impact on stroke prevalence.

According to the Centers for Disease Control and Prevention, stroke is a leading cause of death for Americans, but the risk of having a stroke varies by race and ethnicity. Among Black Americans, the risk of having a first stroke is nearly twice as high as White Americans. Black Americans also have the highest rate of death due to stroke. Additionally, although death rates for stroke have declined for decades among all races and ethnicities, Hispanics have seen an increase in death rates since 2013.204

## Age-Adjusted Hospitalizations from Stroke

The table and figure below show the age-adjusted rate of hospitalization from stroke per 100,000 population for Palm Beach County and Florida from 2015 to 2019. Each year during this timeframe the hospitalization rate was lower in Palm Beach County than in the state. In 2019, the rate was 189.7 per 100,000 in Palm Beach County compared to 236.9 per 100,000 in the state overall. From 2018 to 2019, the rate of hospitalizations from stroke in Palm Beach County increased slightly from 184.5 per 100,000 to 189.7 per 100,000, respectively.

There is no Healthy People 2030 national target specific to hospitalizations from stroke.
Table 196: Age-Adjusted Hospitalizations from Stroke, Rate Per 100,000 Population, Palm Beach County and Florida, 2015-2019

## Age-Adjusted Hospitalizations from Stroke, By Race

The table and figure below show the age-adjusted hospitalization rate from stroke per 100,000 population by race for Palm Beach County and Florida from 2015 to 2019. In Palm Beach County, the rate among Black residents was over double the rate among White residents in the county each year during this timeframe. The rate among White residents in the county decreased from 2015 ( 160.0 per 100,000 ) to 2018 ( 146.7 per 100,000), then slightly increased in 2019 ( 149.9 per 100,000). The rate among Black residents in the county also increased in recent years from 307.0 per 100,000 population in 2017 to 331.2 per 100,000 in 2019.

## Age-Adjusted Hospitalizations from Stroke, By Ethnicity

The table and figure below show the age-adjusted hospitalization rate from stroke per 100,000 population by ethnicity in Palm Beach County and Florida from 2015 to 2019. In both the county and state, the rate was highest among the non-Hispanic population each year reported. From 2018 to 2019, the rate among the Hispanic population in Palm Beach County decreased from 152.6 per 100,000 to 139.1 per 100,000 population, respectively. Alternatively, the rate among the non-Hispanic population increased from 184.7 per 100,000 in 2018 to 193.2 per 100,000 population in 2019.

## Adults Who Have Ever Been Told They Had a Stroke

This table and figure show the percentage of adults who had ever been told they had a stroke in Palm Beach County and Florida in 2013, 2016, and 2019. The percentage of adults in Palm Beach County who had ever been told they had a stroked slightly increased from $2013(2.2 \%)$ to $2019(3.2 \%)$. This percentage was slightly lower than the state each year reported.

There is no Healthy People 2030 national target specific to reducing the percentage of adults who have ever been told they had a stroke.

## Adults Who Have Ever Been Told They Had a Stroke, By Race and Ethnicity

The table and figure below show the percentage of adults who have ever been told they had a stroke for Palm Beach County and Florida by race and ethnicity in 2013, 2016, and 2019. During this timeframe, the percentage of adults in Palm Beach County fluctuated for the non-Hispanic White and Hispanic populations and increased for the nonHispanic Black population. Each year reported, the county rate was lower than the state rate. Most recently in 2019 in Palm Beach County, the percentage was highest among non-Hispanic Black residents (4.3\%), compared to nonHispanic White ( $3.8 \%$ ) and Hispanic ( $1.2 \%$ ) residents.

[^155]
## Chronic Lower Respiratory Disease

Chronic lower respiratory disease (CLRD) is a lung disease that makes it difficult to breathe. Most people with CLRD have both emphysema and chronic bronchitis. According to the Centers for Disease Control and Prevention, CLRD, specifically chronic obstructive pulmonary disease (COPD), was the fourth leading cause of death in the United States in 2018. Based on 2013 data, it was found that the following groups were most likely to be diagnosed with COPD: women, adults ages 65 and older, American Indians/Alaska Natives, multiracial non-Hispanics, current or former smokers, and people with a history of asthma. ${ }^{205}$

## Age-Adjusted Hospitalizations from Chronic Lower Respiratory Disease (Including Asthma)

The following table and figure show the age-adjusted hospitalization rate from CLRD for Palm Beach County and Florida from 2015 to 2019. The Palm Beach County hospitalization rate was lower than the state rate each year aside from 2016. In 2019, the Palm Beach County rate was 234.9 per 100,000 in Palm Beach County compared to the Florida rate of 257.6 per 100,000. In addition, the county rate declined from 2016 ( 361.1 per 100,000) to 2019 (234.9 per 100,000 ).

There is no Healthy People 2030 national target specific to reducing the rate of hospitalization from CLRD.

## Age-Adjusted Hospitalizations from Chronic Lower Respiratory Disease (Including Asthma), By Race

The following table and figure show the age-adjusted hospitalization rate from CLRD for Palm Beach County and Florida by race from 2015 to 2019. From 2015 to 2016, the rate increased among both White and Black residents in Palm Beach County followed by a decline from 2016 to 2019. In 2019, White Palm Beach County residents ( 176.7 per 100,000 ) had a lower hospitalization rate than White Florida residents ( 227.7 per 100,000). This same year, Black Palm Beach County residents ( 350.5 per 100,000) alternatively had a higher hospitalized rate from CLRD than Black Florida residents ( 335.8 per 100,000).

## Adults Who Have Ever Been Told They Had Chronic Obstructive Pulmonary Disease, Emphysema, Or Chronic Bronchitis, By Race and Ethnicity

The following table and graph show the percentage of adults in Palm Beach County and Florida who have ever been told they have COPD, emphysema, or chronic bronchitis by race and ethnicity in 2013, 2016, and 2019. In Palm Beach County the percentage increased among non-Hispanic White residents and non-Hispanic Black residents each year reported. The percentage of Hispanic residents in Palm Beach County who had been told they have COPD, emphysema, or chronic bronchitis decreased from 2013 (7.5\%) to 2016 (2.0\%), then increased in 2019 $(3.4 \%)$. In 2019 in Palm Beach County, the percentage of adults that were ever told they had COPD, emphysema, or chronic bronchitis was $9.3 \%$ among non-Hispanic White residents compared to $4.3 \%$ among non-Hispanic Black and $3.4 \%$ of Hispanic residents.

## Alzheimer's

Alzheimer's disease is the most common type of dementia. Dementia is a general term for the impaired ability to remember, think, or make decisions that interferes with performing daily activities. Dementia mostly affects older adults but is not a part of normal aging. According to the Centers for Disease Control and Prevention, 5.8 million Americans were living with Alzheimer's disease in 2020. Age is the best-known risk factor for Alzheimer's disease. Symptoms of this disease can first appear after age 60 and increase in frequency with increasing age. ${ }^{206}$

## Probable Alzheimer's Cases Among Adults Age 65+

The table and figure below show the proportion of probable Alzheimer's cases among adults 65 and older for Palm Beach County and Florida from 2016 to 2020. The percentage of probable cases among adults 65 and older declined slightly in Palm Beach County from 2017 (15.5\%) to 2020 (14.7\%). However, the percentage in Palm Beach County was higher than the percentage in the state every year during the reported timeframe. In 2019, the percent of probable cases was $14.7 \%$ in Palm Beach County compared to $12.7 \%$ in the state overall.

Healthy People 2030 does not have a national target specific to reducing the percent of probable Alzheimer's cases. However, Healthy People 2030 has set a national goal to improve health and quality of life for people with dementia, including Alzheimer's.

Table 206: Probable Alzheimer's Cases Among Adults Age 65+, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  |  | Florida |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |

[^159]
## Diabetes

Diabetes is a disease that occurs when a person's blood glucose, also called blood sugar, is too high. The most common type of diabetes is type 2 diabetes. Risk factors that put an individual at a higher risk for developing type 2 diabetes include being physically active less than 3 times per week, overweight, 45 years or older, or having a close relative with diabetes. ${ }^{207}$ Individuals with diabetes are twice as likely to have heart disease or suffer a stroke compared to someone who does not have diabetes. ${ }^{208}$ Additionally, those with diabetes are more likely to have these outcomes at a younger age. Moreover, Black Americans, Hispanics, and American Indians or Alaska Natives are at a higher risk for developing diabetes than other races. ${ }^{209}$

## Age-Adjusted Hospitalizations from Or with Diabetes

The following table and figure show the age-adjusted diabetes hospitalization rate per 100,000 population for Palm Beach County and Florida from 2015 to 2019. From 2015 to 2019, the rate in the county fluctuated, with a recent increase from $1,813.9$ per 100,000 in 2018 to $1,845.8$ per 100,000 in 2019. This rate was 1.3 times lower than the Florida rate in 2019 of $2,314.2$ per 100,000.

The Healthy People 2030 national target to reduce hospital admissions for diabetes to 264 per 100,000 adults ages 65 years and over. ${ }^{210}$ While the data below shows the hospitalization rate for all ages, any reduction in these numbers is progress towards a healthier community. However, in Palm Beach County there is a recent increase.

Table 207: Age-Adjusted Hospitalizations from Or with Diabetes, Rate Per 100,000 Population, Palm Beach County and Florida, 2015-2019

| 冬 Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Rate | Count | Rate |

## Age-Adjusted Hospitalizations from Or with Diabetes, By Ethnicity

The table and figure below show the age-adjusted diabetes hospitalization rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2015 to 2019. Each year during this timeframe, the rate was higher among the Hispanic population than the non-Hispanic population in the county. The rate among both the Palm Beach County Hispanic and non-Hispanic populations declined from 2016 to 2018 then increased to 2019. In 2019, the rate was 1,885.6 per 100,000 among Hispanic residents compared to $1,836.8$ per 100,000 among non-Hispanic residents in the county. Among both groups, the rate in the county was consistently lower than the rate among Hispanics and non-Hispanics in the state overall.

## Age-Adjusted Emergency Room Visits Due to Diabetes

The table and figure below show the age-adjusted rate of emergency department visits due to diabetes in Palm Beach County and Florida from 2015 to 2019. Over this time period, the rate in Palm Beach County and Florida fluctuated but ultimately increased overall. In 2019, the rate was lower in Palm Beach County (199.6 per 100,00) compared to the state ( 243.6 per 100,000).

There is no Healthy People 2030 national target specific to reducing the rate of emergency room visits due to diabetes.

## Adults Who Have Ever Been Told They Had Diabetes

The following table and figure show the percentage of adults who had ever been told they had diabetes for Palm Beach County and Florida from 2013 to 2019. During this timeframe in Palm Beach County, the percentage of adults declined slightly and remained lower than the state percentage each year. In 2019, 10.5\% of adults had ever told they had diabetes in the county compared to $11.7 \%$ in the state overall.

While is no Healthy People 2030 national target specific to reducing the of percentage of adults who have ever been told they had diabetes, there is a national target to reduce the number of diabetes cases diagnosed yearly to 5.6 per $1,000 .{ }^{211}$

## Adults Who Have Ever Been Told They Had Diabetes, By Race and Ethnicity

The table and figure below show the percentage of adults who had ever been told they had diabetes by race and ethnicity for Palm Beach County and Florida in 2013, 2016, and 2019. The percentage of adults fluctuated among all racial and ethnic groups in the county over each year reported. Most recently from 2016 to 2019, the Palm Beach County non-Hispanic White rate increased, while the non-Hispanic Black and Hispanic rate decreased. In 2019, this percentage was highest among non-Hispanic Whites (11.6\%) compared to non-Hispanic Blacks ( $9.3 \%$ ) and Hispanics (7.6\%).

## Enteric Disease

Enteric bacteria, including E. coli and Salmonella, are often acquired via contaminated food or water sources. ${ }^{212}$ Common symptoms include diarrhea, nausea, and vomiting. The prevalence of enteric diseases is observed in order to prevent future outbreaks.

## Enteric Disease

This table below shows the enteric disease rate in Palm Beach County and Florida from 2015 to 2019. The rate of enteric disease in Palm Beach County was similar to the Florida rate every year from 2015 to 2019. Moreover, the rate in Palm Beach County and Florida increased from 2017 to 2019. The most recent rate of enteric disease reported in Palm Beach County was 77.6 per 100,00 population.

Healthy People 2030 has not set a national target for enteric diseases.

[^166]
## Infectious Disease

Infectious diseases are illnesses caused by viruses, bacteria, fungi, or parasites and can spread from person-toperson through direct physical contact, droplets in the air, or insects or ticks. There are a wide range of infectious diseases, and signs, symptoms, and treatment are dependent upon the disease. ${ }^{213}$

## Total Reportable Disease Cases

The table and graph below show the rate of reportable disease cases per 100,000 population in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the rate fluctuated but decreased overall from 2017 (285.7 per 100,000 population) to 2020 ( 188.3 per 100,000 population).

There is no Healthy People 2030 national target specific to total reportable diseases; however, there are several indicators related to reducing infections caused by specific infectious diseases.

Table 216: Total Reportable Disease Cases, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Rate | Count |
| 2016 | 3,820 | 273.8 | 54,829 | 271.0 |
| 2017 | 4,032 | 285.7 | 56,811 | 276.4 |

| 2020 | 2,768 | 188.3 | 40,025 | 185.0 |

Note: Data presented here are from Merlin, Florida's web-based reportable disease surveillance system. Data in this report are aggregated by the date the case was reported to the Bureau of Epidemiology, Florida Department of Health. Cases are assigned to Florida counties based on the county of residence at the time of the disease identification, regardless of where they became ill or were hospitalized, diagnosed, or exposed. Disease reporting is an ongoing process. Numbers displayed are preliminary and will fluctuate up or down over time as case reports undergo further investigation and validation. Counts include confirmed and probable cases. Summaries of reportable disease data are produced weekly, monthly, and annually and are located on the Bureau of Epidemiology's Data and Publication page. More detailed information on interpreting data can be found in the Introduction Section of the Annual Morbidity Statistics Reports (AMSR) and final disease counts are found in the AMSR. For questions, please contact the Bureau of Epidemiology at (850) 245-4401. Source: Florida Department of Health, Bureau of Community Health Assessment, 2021

## Tuberculosis

## Tuberculosis Cases

The table below shows the rate of tuberculosis cases per 100,000 population in Palm Beach County and Florida from 2016 to 2020. While the rate in Palm Beach County declined from 2016 ( 3.8 per 100,000) to 2018 ( 2.4 per 100,000), there was a slight increase in 2019 ( 2.9 per 100,000). In 2020, the Palm Beach County rate decreased to 2.2 per 100,000 population, which was slightly higher than the Florida rate of 1.9 per 100,000 population.

The Healthy People 2030 national target is to reduce the rate of new tuberculosis cases to 1.4 per 100,000 population. ${ }^{214}$ As demonstrated in the table below, both Palm Beach County and Florida rates are not yet meeting that target.

Table 217: Tuberculosis Cases, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Rate | Count |

[^167]Human immunodeficiency virus, also known as HIV, is a virus that attacks the body's immune system and is spread by having unprotected sex or sharing needles, syringes, or other equipment used to inject drugs. ${ }^{215}$ If left untreated, HIV leads to acquired immunodeficiency syndrome, or AIDS. With proper medical care and effective HIV treatment, people with HIV can live healthy lives.

## HIV Diagnoses

The table and graph below show the rate of HIV diagnoses per 100,000 population in Palm Beach County and Florida from 2015 to 2019. From 2017 to 2019, the rate declined in both Palm Beach County and the state. In 2019, the rate of HIV diagnoses was 16.9 per 100,000 in Palm Beach County and 21.4 per 100,000 population in the state.

The Healthy People 2030 national target is to reduce the number of new HIV diagnoses among persons ages 13 years and over to 3,835 . ${ }^{216}$ While the data presented below shows the number of new HIV diagnoses for all ages, there has been a decrease from 282 in 2015 to 247 in 2019.

Table 218: HIV Diagnoses, Palm Beach County and Florida, 2015-2019

| Year | Palm Beach County |  | Florida |  |  |
| :--- | ---: | ---: | ---: | ---: | :---: |
|  | Count |  | Rate |  |  |

## HIV Diagnoses, By Race

The table and graph below show the rate of HIV diagnoses per 100,000 population by race in Palm Beach County and Florida from 2015 to 2019. As displayed in the graph, there is a major disparity between the non-Hispanic White rate and non-Hispanic Black rate in Palm Beach County and Florida each year reported. In Palm Beach County, the non-Hispanic White rate increased from 2016 ( 8.4 per 100,000) to 2018 ( 9.0 per 100,000), then declined in 2019 ( 7.5 per 100,000 ). The non-Hispanic Black rate in Palm Beach County declined steadily from 64.7 per 100,000 population in 2016 to 45.0 per 100,000 population in 2019. In 2019, the Palm Beach County Non-Hispanic White and NonHispanic Black rate were both lower than the state rates.

## HIV Diagnoses, By Ethnicity

The table and graph below show the rate of new HIV diagnoses per 100,000 population by ethnicity in Palm Beach County and Florida from 2015 to 2019. The rate among non-Hispanic residents in Palm Beach County declined from 2016 ( 21.5 per 100,000) to 2019 ( 16.5 per 100,000). The rate among Hispanic residents in Palm Beach County fluctuated, with an increase most recently from 17.7 per 100,000 population in 2018 to 18.5 per 100,000 population in 2019. Additionally, in 2019, the Palm Beach County Hispanic ( 18.5 per 100,000) and non-Hispanic ( 16.5 per 100,000 ) rates among residents were both lower than the state rates among Hispanic ( 28.9 per 100,000) and nonHispanic ( 18.8 per 100,000) residents.

[^170]
## HIV Testing

HIV testing is important because it can lead to early diagnosis and treatment. Crucially, people that don't know they have the disease are more likely to spread it.

## Adults Less than 65 Years of Age who Have Ever Been Tested for HIV

The following table shows the percentage of adults under 65 years of age who have ever been tested for HIV in Palm Beach County and Florida in 2007, 2010, 2013, 2016, and 2019. In the county and state, the rate increased in 2013, 2016, and 2019. However, the Palm Beach County rate was lower than the Florida rate each year reported except 2007.

There is no Healthy People 2030 national target specific to this exact indicator; however, there is a national target to increase knowledge of HIV status to $95 \%$. ${ }^{217}$

Table 221: Adults Less Than 65 Years of Age Who Have Ever Been Tested for HIV, Palm Beach County and Florida, 2007, 2010, 2013, 2016, 2019

## Adults Less than 65 Years of Age Who Have Ever Been Tested for HIV, By Race and Ethnicity

The table below shows the percentage of adults under 65 years of age who have ever been tested for HIV in Palm Beach County and Florida in 2007, 2010, 2013, 2016, and 2019 by race and ethnicity. From 2016 to 2019 in Palm Beach County, the rate among non-Hispanic White residents increased from 47.9\% to 49.0\% and the rate among non-Hispanic Black residents also increased from $45.4 \%$ to $75.0 \%$. During this same time period, the Hispanic rate decreased from $71.7 \%$ to $52.7 \%$. Notably, in 2019, the non-Hispanic Black rate of $75.0 \%$ was higher than the state rate of $73.5 \%$.

## Adults Less than 65 Years of Age Who Had and HIV Test in the Past 12 Months

This table shows the percentage of adults under 65 years of age who had an HIV test in the past 12 months in Palm Beach County and Florida in 2007, 2010, 2013, and 2016. In the years reported since 2010, the percentage increased steadily in both Palm Beach County and Florida. Most recently in 2016, the percentage of adults less than 65 years of age who had an HIV test in the past 12 months was $21.0 \%$ in Palm Beach County and $19.7 \%$ in the state.

## Adults Less Than 65 Years of Age Who Had an HIV Test in the Past 12 Months, By Race and Ethnicity

This table shows the percentage of adults under 65 years of age who had an HIV test in the past 12 months in Palm Beach County and Florida in 2007, 2010, 2013, and 2016 by race and ethnicity. In 2016, the percentages for nonHispanic Black ( $26.7 \%$ ) and Hispanic (23.6\%) residents were the highest among all demographic groups in Palm Beach County. However, both percentages were lower than the percentages among Florida non-Hispanic Black ( $36.1 \%$ ) and Hispanic ( $24.1 \%$ ) residents.

## Acquired Immunodeficiency Syndrome (AIDS)

## AIDS Diagnoses

The following table and graph show the rate of new AIDS diagnoses per 100,000 population in Palm Beach County and Florida from 2015 to 2019. The rate in Palm Beach County fluctuated from 2015 to 2019. The rates among Palm Beach County residents in $2018(6.7$ per 100,000) and $2019(7.6$ per 100,000) were lower than the rates among Florida residents in 2018 ( 9.1 per 100,000) and 2019 ( 8.9 per 100,000) overall.

There is no Healthy People 2030 national target associated with AIDS diagnoses.
Table 225: AIDS Diagnoses, Palm Beach County and Florida, 2015-2019

## AIDS Diagnoses, By Race

The following table and graph show the rate of new AIDS diagnoses per 100,000 population in Palm Beach County and Florida from 2015 to 2019 by race. While the non-Hispanic White and non-Hispanic Black rates both fluctuated in Palm Beach County during this timeframe, the graph shows a general downward trend for all races listed at the county and state level. Additionally, there was a large disparity between the non-Hispanic White and non-Hispanic Black rate each year in Palm Beach County and Florida. For example, in 2019, the rate of AIDS diagnoses among non-Hispanic White residents in Palm Beach County was 2.5 per 100,000 population and the rate of AIDS diagnoses among non-Hispanic Black residents was 24.7 per 100,000 population.

## AIDS Diagnoses, By Ethnicity

The table and graph below show the rate of AIDS diagnoses in Palm Beach County and Florida from 2015 to 2019 by ethnicity. The rate among Palm Beach County non-Hispanic residents declined from 2015 (11.9 per 100,00) to 2018 ( 7.3 per 100,000), then slightly increased in 2019 ( 7.8 per 100,000). The rate among Palm Beach County Hispanic residents fluctuated during this time frame, with an increase most recently from 4.4 per 100,000 population in 2018 to 6.9 per 100,000 population in 2019.

## Sexually Transmitted Diseases/Infections

## Gonorrhea, Chlamydia, and Infectious Syphilis Cases

The following table and graph show the rate of gonorrhea, chlamydia, and infectious syphilis cases in Palm Beach County and Florida from 2015 to 2019. In both Palm Beach County and Florida, the rate increased over this time period. The Palm Beach County rate was lower than the Florida rate for every year from 2015 to 2019. For example, the rate in 2019 among Palm Beach County residents was 182.6 per 100,000 population and the rate among Florida residents overall was 238.5 per 100,000.

There is no Healthy People 2030 national target directly associated with this health indicator, but related national targets include: reduce gonorrhea rates in male adolescents and young men to 471.2 per 100,000 population; increase the proportion of sexually active female adolescents and young women who get screened for chlamydia to $76.5 \%$; and reduce the syphilis rate in females and men who have sex with men. 218219220

## Unintentional Injury

## Hospitalizations for Firearm Injuries

Firearm injury is defined as a gunshot wound or penetrating injury from a weapon that uses a powder charge to fire a projectile. This definition includes gunshot injuries from handguns, rifles, and shotguns. This does not include injuries from air- and gas-powered guns, such as pellet guns. ${ }^{221}$

In 2019, there were 39,707 firearm-related deaths in the United States. That same year, six out of every ten fire-arm related deaths were suicides, and more than three out of every ten were homicides. Among medically treated injuries in 2019, seven out of every ten were from firearm-related assaults, and two out of every ten were unintentional firearm injuries. ${ }^{222}$

Additionally, in 2020, according to the Gun Violence Archive, approximately 19,300 lives were lost due to gun homicides and non-suicide related shootings, a $25 \%$ increase from 2019. While gun violence has been a growing public health crisis over the past decade, the COVID-19 pandemic has intensified its impact. The financial hardship, stress, increase in alcohol consumption, and increase in domestic violence caused by the pandemic are contributing factors to this alarming increase. ${ }^{223}$

## Hospitalizations for Non-Fatal Firearm Injuries

The table and figure below show the hospitalization rates from non-fatal firearm injuries per 100,000 population for Palm Beach County and Florida from 2015 to 2019. Each year during this timeframe, this Palm Beach County rate was higher than the Florida rate. Most recently in 2019, the Palm Beach County rate decreased from 12.9 per 100,000 in 2018 to 9.3 per 100,000 in 2019.

The Healthy People 2030 national target is to reduce the rate of non-fatal firearm injuries to 10.1 per 100,000. ${ }^{224}$ As of 2019, Palm Beach County is meeting the Healthy People 2030 target for this indicator.

## Hospitalizations for Non-fatal Firearm Injuries, By Race

According to the Centers for Disease Control and Prevention, some groups have a higher rate of firearm injury based on age, race, ethnicity, and gender. Regarding gender, males account for $86 \%$ of all firearm death victims and $87 \%$ of non-fatal firearm injuries. Regarding age, firearm homicide rates are highest among teens and young adults ages 15 to 34 years. Additionally, rates are highest among Black and American Indian/Alaskan Native when comparing races and among Hispanic populations when comparing ethnicities. ${ }^{225}$

The table and figure below show the hospitalization rates from non-fatal firearm injuries per 100,000 population by race in Palm Beach County and Florida from 2015 to 2019. In Palm Beach County, the rate decreased overall for Black residents during this timeframe but remained much higher compared to White residents every year reported. For example, in 2019 , the rate among Black residents ( 29.9 per 100,000 ) was nearly eight times higher than the rate among White residents ( 3.8 per 100,000) .

The Healthy People 2030 national target is to reduce the rate of non-fatal firearm injuries to 10.1 per 100,000. ${ }^{226}$ While Palm Beach County as a whole was meeting the Healthy People 2030 target for this indicator as of 2019, when looking at the data by race the rate among Black residents exceeds the national target by nearly 3 times.

Table 230: Hospitalizations for Non-Fatal Firearm Injuries, Rate Per 100,000 Population, By Race, Palm Beach County and Florida, 2015-2019

| Year | Palm Beach County |  |  |  | Florida |  |  |  |

## Hospitalizations for Non-Fatal Firearm Injuries, By Ethnicity

The table and figure below show the hospitalization rate from non-fatal firearm injuries per 100,000 population for Palm Beach County and Florida by ethnicity from 2015 to 2019. In Palm Beach County, the rate among the Hispanic and non-Hispanic populations fluctuated but decreased overall. With the exception of 2018, Palm Beach County Hispanic residents had a higher rate than Hispanics in the entire state. Additionally, the non-Hispanic rate in Palm Beach County was higher than the non-Hispanic rate in the state. Non-Hispanic residents in Palm Beach County were much more likely to be hospitalized for non-fatal firearm injuries compared to Hispanic residents every year reported. Most recently in 2019, the non-fatal firearm injury hospitalization rate was 5.7 per 100,000 among Hispanic residents in Palm Beach County compared to 10.0 per 100,000 among non-Hispanics residents.

## Hospitalizations for Unintentional Falls

According to the Florida Department of Health, unintentional falls are the leading cause of fatal and non-fatal injuries among Florida residents ages 65 years and older. In addition to deaths and injuries, and the costs associated with them, falls can have many negative consequences for older adults including the fear of falling again, forced relocation from the home, loss of independence, and stress in the family. By reducing their chances of falling, older adults can stay independent and maintain a high level of quality of life. ${ }^{227}$

## Hospitalizations for Unintentional Falls

The table and graph below show the unintentional falls hospitalization rate per 100,000 population for Palm Beach and Florida from 2015 to 2019. During this timeframe, the Palm Beach County rate was consistently higher than the state rate. The Palm Beach County rate increased from 425.4 per 100,000 in 2018 to 443.5 per 100,000 in 2019, which was much higher than the 2019 Florida rate of 353.8 per 100,000.

There is no Healthy People 2030 national target specific to unintentional falls.
Table 232: Hospitalizations for Unintentional Falls, Rate Per 100,000 Population, Palm Beach County and Florida, 2015-2019

| Year | Palm Beach County |  | Florida |  |

[^178]
## Hospitalizations for Unintentional Falls, By Race

The table and figure below show hospitalization rate from unintentional falls per 100,000 population by race for Palm Beach County and Florida from 2015 to 2019. Each year during this timeframe, the hospitalization rate among White residents was much higher than the rate among Black residents in both the county and the state. From 2018 to 2019, the rate increased among Palm Beach County White residents from 500.6 per 100,000 to 511.6 per 100,000 and among Black residents from 116.0 per 100,000 to 142.0 per 100,000. The hospitalization rate for unintentional falls among White and Black residents in Palm Beach County was higher than their respective state rate in 2019.

Table 233: Hospitalizations for Unintentional Falls, Rate Per 100,000 Population, By Race, Palm Beach County and Florida, 2015-2019

## Hospitalizations for Unintentional Falls, By Ethnicity

The table and figure below show the hospitalization rate from unintentional falls per 100,000 population by ethnicity in Palm Beach County and Florida from 2015 to 2019. The hospitalization rate increased overall among both Palm Beach County Hispanic and non-Hispanic residents during this timeframe. In addition, the rate among non-Hispanic residents in the county was higher than the state each year reported. In 2019, Hispanic residents (175.3 per 100,000) had a lower hospitalization rate than non-Hispanic residents $(512.8$ per 100,000$)$ in Palm Beach County.

Table 234: Hospitalizations for Unintentional Falls, Rate Per 100,000 Population, By Ethnicity, Palm Beach County and Florida, 2015-2019

## Preventable Hospitalizations

Ambulatory care sensitive conditions are conditions where timely and effective ambulatory or outpatient care can decrease hospitalization by preventing the onset of an illness or condition, by controlling an acute episode of an illness or by managing a chronic disease or condition. ${ }^{228}$ High rates of ambulatory care sensitive hospitalizations in a community may be an indicator of poor prevention efforts, a primary care resource shortage, poor performance of primary care delivery systems, or other factors that create barriers to obtaining timely and effective care. Due to the emergence of the COVID-19 pandemic in 2020, future data related to preventable hospitalizations may show increases in these areas as residents delayed care, screenings, and elective surgeries for other issues in light of the pandemic.

## Preventable Hospitalizations Under 65 from All Conditions

The table and figure below show the rate per 100,000 population of preventable hospitalizations from all conditions among adults ages 65 and under for Palm Beach County and Florida from 2015 to 2019. During this timeframe, this rate decreased overall in Palm Beach County and at the state level. In 2019, the rate was 875.4 per 100,000 in the county and 928.6 per 100,000 in the state.

There is no Healthy People 2030 national target specific to reducing the rate of preventable hospitalizations from all conditions among those ages 65 and under.

Table 235: Preventable Hospitalizations Under 65 from All Conditions, Rate Per 100,000 Population Under 65, Palm Beach County and Florida, 2015-2019

## Preventable Hospitalizations Under 65 from Severe Ear, Nose, \& Throat Infections

This table and figure show the rate of preventable ear, nose, and throat infection hospitalizations per 100,000 population ages 65 years and under in Palm Beach County and Florida from 2015 to 2019. From 2016 to 2019, the rate decreased in Palm Beach County and the state overall. In 2019, the rate was higher at the county level ( 18.2 per 100,000 ) compared to the state level ( 15.8 per 100,000 ).

There is no Healthy People 2030 national target specific to reducing the rate of preventable hospitalizations from ear, nose and throat infections among those ages 65 and under.

Table 236: Preventable Hospitalizations Under 65 from Severe Ear, Nose, \& Throat Infections, Rate Per 100,000 Population Under 65, Palm Beach County and Florida, 2015-2019

## Preventable Hospitalizations Under 65 from Kidney/Urinary Infection

The table and figure below show the rate of hospitalizations due to preventable kidney and urinary infection per 100,000 population under 65 years old in Palm Beach County and Florida from 2015 to 2019. During this timeframe, this rate decreased in Palm Beach County and the state overall. However, there was a slight increase in the rate in Palm Beach County from $2018(30.9$ per 100,000) to $2019(31.9$ per 100,000). In 2019, the rate was higher at the county level ( 31.9 per 100,000) compared to the state level ( 25.3 per 100,000).

There is no Healthy People 2030 national target specific to reducing the rate of preventable hospitalizations from kidney and urinary tract infections among those ages 65 and under; however, related national targets include to reduce the rate of hospital admissions for urinary tract infections among older adults to 496.2 per 100,000 adults aged 65 and older. ${ }^{229}$

## Preventable Hospitalizations Under 65 from Dehydration - Volume Depletion

This table and figure show the rate of preventable dehydration hospitalizations per 100,000 population under 65 years old in Palm Beach County and Florida from 2015 to 2019. During this timeframe, the rate decreased steadily in Palm Beach County and the state. In 2019, the rate was higher in the county ( 63.9 per 100,000) compared to the state ( 52.4 per 100,000).

There is no Healthy People 2030 national target specific to dehydration.

## Preventable Hospitalizations Under 65 from Gastroenteritis

The following table and figure show the rate of preventable gastroenteritis hospitalizations per 100,000 population under 65 years old in Palm Beach County and Florida from 2015 to 2019. From 2016 to 2019, the rate decreased in Palm Beach County and the state. In 2019, the rate was higher in the county ( 41.3 per 100,000) compared to the state (42.2 per 100,000).

There is no Healthy People 2030 national target specific to gastroenteritis.

## Mortality

## Leading Causes of Death

In 2020, the leading cause of death in the United States was heart disease, followed by cancer, COVID-19, accidents, stroke, chronic lower respiratory diseases, Alzheimer's disease, diabetes, influenza and pneumonia, and nephritis. ${ }^{230}$ Crucially, heart disease and cancer both account for roughly 600,000 deaths or more every year, while no other leading cause of death passes 351,000 .

## Leading Causes of Death

The table below shows the leading causes of death in Palm Beach County in 2020. Heart disease and cancer were the leading causes of death, together accounting for $42.5 \%$ of all deaths in the county in 2020. COVID-19, Stroke, unintentional injury, and chronic lower respiratory disease followed, collectively accounting for $27.1 \%$ of all deaths in the county.

Table 240: Leading Causes of Death, Palm Beach County, 2020

| Cause of Death | Deaths | Percent of <br> Total <br> Deaths | Crude <br> Rate Per <br> 100,000 | Age- <br> Adjusted <br> Death <br> Rate Per <br> 100,000 | YPLL < 75 <br> Per <br> 100,000 <br> Under 75 |

## Age-Adjusted Death Rate

## Age-Adjusted Death Rate

The national age-adjusted death rate declined in the past decade, from 749.6 per 100,000 population in 2009 to 723.6 in 2018. ${ }^{231}$ The table below shows the age-adjusted death rate in Palm Beach County and Florida from 2016 to 2020. During this time frame, both the Palm Beach County and the state age-adjusted death rate stayed relatively stable between 2016 and 2017, followed by notable decreases in both 2018 and 2019. In 2020, however, a major spike in the age-adjusted death rates for both Palm Beach County and Florida was reported. Across all years, the Palm Beach County rate was much lower than the Florida rate.

Table 241: Age-Adjusted Death Rate, Rate per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

## Heart Disease Deaths

Heart disease encompasses many types of heart conditions and is the leading cause of death in the United States. Symptoms of heart disease often go unnoticed until someone has a cardiac event, such as a heart attack or heart failure. Heart disease is largely preventable through diet and lifestyle habits. High blood pressure, also known as hypertension, high cholesterol, and smoking status are significant risk factors for heart disease. ${ }^{232}$

## Deaths from Major Cardiovascular Diseases

Major cardiovascular diseases include all diseases that affect the cardiovascular system.

## Age-Adjusted Deaths from Major Cardiovascular Diseases

The table and graph below show the age-adjusted death rate per 100,000 from major cardiovascular diseases in Palm Beach County and Florida from 2016 to 2020. The rate among Palm Beach County residents declined from 2017 ( 177.3 per 100,00) to 2019 ( 173.6 per 100,000), then increased most recently in 2020 ( 184.2 per 100,000). Additionally, the rate among Palm Beach County residents was lower than the rate among Florida residents overall each year reported.

There is no Healthy People 2030 national target directly associated with cardiovascular disease deaths, but there is a national target to improve cardiovascular health in adults, increasing the current mean cardiovascular health score to 3.5. ${ }^{233}$ With improved cardiovascular health, there is likely to be a decrease in cardiovascular disease deaths.

Table 242: Age-Adjusted Deaths from Major Cardiovascular Diseases, Rate per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |

## Age-Adjusted Deaths from Major Cardiovascular Diseases, By Race

This table and graph below show the age-adjusted death rate per 100,000 population from major cardiovascular diseases by race in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County and Florida, the rate among White and Black residents fluctuated. However, most recently, the rate among White Palm Beach county residents increased from 166.9 per 100,000 in 2019 to 175.3 per 100,000 in 2020 . Similarly, the rate among Black Palm Beach County residents also increased from 218.1 per 100,000 in 2019 to 245.7 per 100,000 in 2020. Each year from 2016 to 2020, the rate among Palm Beach County White and Black residents was lower than the rate among White and Black residents in Florida overall.

## Age-Adjusted Deaths from Major Cardiovascular Diseases, By Ethnicity

The following table and graph show the age-adjusted death rate per 100,000 population from major cardiovascular diseases in Palm Beach County and Florida from 2016 to 2020 by ethnicity. The rate among non-Hispanic residents in Palm Beach County was higher than the rate among Hispanic residents each year during this time frame. The highest rate reported in Palm Beach County was 187.9 per 100,000 among the non-Hispanic resident population in 2020. Additionally, the rate among Hispanic and non-Hispanic residents in Palm Beach County was lower than the rate among Hispanic and Non-Hispanic residents each year from 2016 to 2020.

## Deaths from Hypertension

According to the American Heart Association, hypertension, or high blood pressure, is when the force of blood flowing through your blood vessels is consistently too high resulting in long term damage to your circulatory system when left untreated. High blood pressure is a significant contributing factor to heart attack, stroke, diabetes, and other major health issues. Nearly half of Americans have high blood pressure, many of whom are unaware. ${ }^{234}$

## Age-Adjusted Deaths from Hypertension

The table below shows the age-adjusted hypertension death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. The rate among residents in Palm Beach County declined from 2017 ( 6.0 per 100,000) to 2019 ( 5.0 per 100,000), then increased in 2020 ( 6.4 per 100,000). Additionally, the rate among Palm Beach County residents was lower than the rate among Florida residents overall each year during this timeframe.

There is no Healthy People 2030 national target directly associated with hypertension deaths; however, there is a national target to increase control of high blood pressure in adults to $60.8 \%$, which would contribute to a decrease in associated deaths. ${ }^{235}$

## Age-Adjusted Deaths from Hypertension, By Race

The table and graph below show the age-adjusted hypertension death rate per 100,000 population by race in Palm Beach County and Florida from 2016 to 2020. The rate among Palm Beach County Black residents declined from 2016 ( 11.9 per 100,000) to 2018 ( 7.7 per 100,000), then increased in 2019 ( 12.2 per 100,000) and $2020(14.8$ per $100,000)$. The rate among Palm Beach County White residents fluctuated during this time frame, increasing most recently from 4.4 per 100,000 in 2019 to 5.4 per 100,000 in 2020. The death rate among Palm Beach County Black residents was at least double the rate among White residents each year during this time frame, except 2018.

## Age-Adjusted Deaths from Hypertension, By Ethnicity

The table and graph below show the age-adjusted hypertension death rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2016 to 2020. Most notably, the rate among Palm Beach County non-Hispanic residents decreased from 2017 ( 5.9 per 100,000) to 2019 ( 5.2 per 100,000), then increased in 2020 ( 7.0 per 100,000 ). The rate among Hispanic Palm Beach County residents was 3.7 per 100,000 in 2020. Additionally, the rate among Palm Beach County non-Hispanic residents was higher than the rate among Hispanic residents in 2019 and 2020.

## Deaths from Coronary Heart Disease

The National Heart, Lung, and Blood Institute of the National Institutes of Health defines coronary heart disease as a type of heart disease that develops when the arteries of the heart cannot deliver enough oxygen-rich blood to the heart. Many people do not know that they have this disease, and lifestyle and behaviors are important factors for prevention. ${ }^{236}$

## Age-Adjusted Deaths from Coronary Heart Disease, By Sex

The table and graph below show the age-adjusted coronary heart disease death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020 by sex. There was a significant disparity between the male and female rate each year during this time frame for both Palm Beach County and Florida, with the rate among male residents being much higher than the rate among females. In Palm Beach County, the rate among male residents decreased each year from 2017 (120.1 per 100,000) to 2019 (112.3 per 100,000), then increased in 2020 (122.4 per 100,000). The rate among female Palm Beach County residents increased from 2017 ( 60.7 per 100,000) to 2020 ( 69.2 per 100,000 ). In 2020, the rate among Palm Beach County male ( 122.4 per 100,000) and female ( 69.2 per 100,000) residents was higher than the rate among Florida male ( 121.9 per 100,000 ) and female ( 64.3 per 100,000) residents.

The Healthy People 2030 national target is to reduce the age-adjusted rate of coronary heart disease deaths to 71.1 per 100,000 population. ${ }^{237}$ In Palm Beach County, as of 2020, the male rate was much higher than this target and the female rate was slightly lower.

## Age-Adjusted Deaths from Coronary Heart Disease, By Race

This table and graph show the age-adjusted coronary heart disease death rate per 100,000 population by race in Palm Beach County and Florida from 2016 to 2020. Notably, the rate among Palm Beach County Black residents declined from 2016 ( 104.4 per 100,000) to 2019 ( 87.6 per 100,000), then increased dramatically in 2020 ( 109.1 per 100,000 ). Additionally, the rate among Palm Beach County Black residents was higher than the rate among White residents each year from 2016 to 2020. In 2020, the rate among Palm Beach County White residents was 91.1 per 100,000.

## Age-Adjusted Deaths from Coronary Heart Disease, By Ethnicity

The table and graph below show the age-adjusted coronary heart disease death rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2016 to 2020. While the rate among both the Palm Beach County Hispanic and non-Hispanic residents fluctuated during this time frame, both increased most recently in 2020. In 2020, the rate among Palm Beach County Hispanic residents was 79.8 per 100,000, while the rate among Non-Hispanic residents was 94.3 per 100,000. Additionally, the rates among Palm Beach County Hispanic and non-Hispanic residents were lower than their respective Florida rates each year, except in 2020.

## Stroke Deaths

According to the American Stroke Association, stroke is the fifth leading cause of death and the leading cause of disability nationwide. Strokes occur when either a clot obstructs the blood flow to the brain or a blood vessel bursts preventing blood flow to the brain, and thus can cause damage to the brain in varying degrees. Because of this, having a stroke can cause parts of the body to not work, impacting long-term quality of life and in some cases causing death. ${ }^{238}$ Similar to heart disease, strokes are largely preventable through lifestyle and behavior modifications and medication adherence. Importantly, future data may show increases in stroke-related deaths due to the fact that COVID-19 may increase the risk of stroke. ${ }^{239}$

[^194]
## Age-Adjusted Deaths from Stroke

This table and graph below show the age-adjusted stroke death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the rate increased from 36.4 per 100,000 in 2018 to 40.6 per 100,000 in 2020. For each year from 2016 to 2020, the rate among Palm Beach County residents was lower than the rate among Florida residents overall.

The Healthy People 2030 national target is to reduce stroke deaths per 100,000 population to 33.4 per 100,000 population. ${ }^{240}$ As of 2020, Palm Beach County was not yet meeting this target with 40.6 stroke-related deaths per 100,000 population.

## Age-Adjusted Deaths from Stroke, By Race

This table and graph show the age-adjusted stroke death rate per 100,000 population by race in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the rate among Black residents was higher than the rate among White residents each year during this timeframe Most recently in 2020, the rate among Black residents in Palm Beach County was 62.0 per 100,000, while the rate among White residents was 37.8 per 100,000. The death rate among White and Black Palm Beach County residents increased from 2019 to 2020.

## Age-Adjusted Deaths from Stroke, By Ethnicity

The table and graph below show the age-adjusted stroke death rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2016 to 2020. In recent years, the rate among Hispanic residents rose from 32.7 per 100,000 in 2018 to 40.3 per 100,000 in 2020, and the rate among non-Hispanic residents rose from 36.6 per 100,000 in 2018 to 40.9 per 100,000 in 2019. Additionally, both county rates in 2020 were lower than their respective state rates that same year.

## Cancer Deaths

Cancer is a disease that can start almost anywhere in the body and spreads to other parts of the body via abnormal or damages cells growing uncontrollably. These abnormal or damages cells form tumors that can be cancerous. ${ }^{241}$ Cancer is complex and includes a number of diseases that have their own risk factors, some controllable and some uncontrollable. For instance, controllable risk factors for cancer include, but are not limited to, tobacco use, sun exposure, drinking alcohol, and diet. ${ }^{242}$

According to the American Cancer Society, one in three people will be diagnosed with cancer during their lifetime, and early screening and detection increases the likelihood of being cured. ${ }^{243}$ Additionally, certain population groups experience cancer disparities due to barriers in accessing quality primary and specialty health care. ${ }^{244}$

## Age-Adjusted Cancer Deaths

The table and graph below show the age-adjusted cancer death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. The rate among Palm Beach County and Florida residents declined each year from 2016 to 2020. The rate among Palm Beach County residents in 2020 was 122.0 per 100,000, which was lower than the state rate of 138.7 per 100,000 that same year.

The Healthy People 2030 national target is to reduce the overall cancer death rate to 122.7 per 100,000 population. ${ }^{245}$ As of 2020, Palm Beach County is meeting that target with a cancer death rate of 122.0 per 100,000 population.

## Age-Adjusted Cancer Deaths, By Race

This table and graph below show the age-adjusted cancer death rate per 100,000 population by race in Palm Beach County and Florida from 2016 to 2020. The rate among Palm Beach County White residents declined from 2016 ( 140.5 per 100,000 ) to 2019 ( 119.9 per 100,000), then increased slightly in 2020 ( 122.3 per 100,000). The rate among Palm Beach County Black residents increased from 2017 (125.9 per 100,000) to 2019 ( 141.3 per 100,000), then decreased in 2020 ( 124.9 per 100,000). The rate among Palm Beach County White and Black residents was lower than the respective Florida rate every year from 2016 to 2020.

## Age-Adjusted Cancer Deaths, By Ethnicity

The table and graph below show the age-adjusted cancer death rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2016 to 2020. The rate among Palm Beach County Hispanic residents declined from 2016 (121.3 per 100,000) to 2019 ( 89.8 per 100,000), then increased in 2020 ( 103.1 per 100,000). The rate among Palm Beach County non-Hispanic residents declined each year from $2016(142.9$ per 100,000) to $2020(124.6$ per $100,000)$. However, the rate among non-Hispanic residents remained much higher than the rate among Hispanic residents each year at the county level.

## Tobacco-Related Cancer Deaths

## Tobacco-Related Cancer Deaths to Persons 35 and Over

The table and graph below show the tobacco-related cancer death rate per 100,000 population for persons ages 35 and over in Palm Beach County and Florida from 2016 to 2020. The Palm Beach County and Florida rate declined year over year during this timeframe. Each year, aside from 2016, the cancer death rate among county residents was lower than the death rate among Florida residents as a whole.

There is no Healthy People 2030 national target directly related to this health indicator.

## Tobacco-Related Cancer Deaths to Persons 35 and Over, By Race

This table and graph below show the tobacco-related cancer death rate per 100,000 by race for persons ages 35 and over in Palm Beach County and Florida from 2016 to 2020. Each year from 2016 to 2020, except 2019, the death rate among White residents was more than double the rate among Black residents. For example, in 2020 the rate among White Palm Beach County residents of 171.0 per 100,000 population while the rate among Black residents was 79.4 per 100,000. Additionally, the rate among statewide White residents in 2020 was 166.0 per 100,000, lower than the respective county rate that same year.

## HIVIAIDS Deaths

The human immunodeficiency virus (HIV) is spread by having unprotected sex or sharing needles, syringes, or other equipment used to inject drugs. ${ }^{246}$ With proper medical care, effective HIV treatment and viral load suppression, people living with HIV can live long, healthy lives. In addition, with these great advances, those with undetectable viral loads are not able to transmit the virus sexually.

## Age-Adjusted Deaths from HIV/AIDS

The table and graph below show the age-adjusted death rate per 100,000 population from HIV/AIDS in Palm Beach County and Florida from 2016 to 2020. The death rate among residents in Palm Beach County fluctuated over this timeframe, ultimately increasing slightly from 2.8 per 100,000 in 2019 to 2.9 per 100,000 in 2020. In 2020, the rate among Palm Beach County residents ( 2.9 per 100,000 ) was higher than the rate among Florida residents ( 2.7 per 100,000 ) overall.

There is no Healthy People 2030 national target directly associated with this health indicator.

## Age-Adjusted Deaths from HIV/AIDS, By Race

The table and graph below show the age-adjusted death rate per 100,000 population from HIV/AIDS in Palm Beach County and Florida from 2016 to 2020 by race. Across all years, the rate among Palm Beach County Black residents was much higher than the rate among White residents. Additionally, the rate among Palm Beach County Black residents was higher than the rate among Black residents in Florida overall each year, except 2016. In 2020, the rate among Palm Beach County White residents was 0.9 per 100,000 and the rate among Black residents was 11.8 per 100,000.

## Age-Adjusted Deaths from HIV/AIDS, By Ethnicity

The following table and graph below show the age-adjusted death rate per 100,000 population from HIV/AIDS in Palm Beach County and Florida from 2016 to 2020 by ethnicity. From 2015 to 2019, the rate among Palm Beach County Hispanic and non-Hispanic residents fluctuated but generally declined, as depicted in the graph. Notably, the rate among Palm Beach County non-Hispanic residents was higher than the rate among Hispanic residents each year. In 2019, for example, the death rate among non-Hispanics was 3.1 per 100,000 and the rate among Hispanics was 0.8 per 100,000 in Palm Beach County.

## Unintentional Injury Deaths

Unintentional injuries are injuries that were unplanned and could have been prevented. Unintentional injuries are the leading cause of death for individuals under 45 years of age nationwide, and prevention efforts are critical to keeping people safe. ${ }^{247}$

Unintentional injuries include, but are not limited to, motor vehicle crashes, other land transport accidents, water/air/space transport accidents, falls, firearms discharge, drowning, smoke, fire and flame exposure, and poisoning and noxious substance exposure. ${ }^{248}$

## Age-Adjusted Deaths from Unintentional Injury

The table and graph below show the age-adjusted unintentional injury death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. Each year over this time period, the rate among Palm Beach County residents was higher than the rate among Florida residents overall. Most recently, the rate among Palm Beach County residents increased from 55.6 per 100,000 population in 2018 to 72.4 per 100,000 population in 2020.

The Healthy People 2030 national target is to reduce the unintentional injury death rate to 43.2 per 100,000 population. ${ }^{249}$ As shown in the table below, Palm Beach County was not yet meeting this target as of 2020, with 72.4 per 100,000 population.

## Age-Adjusted Deaths from Unintentional Injury, By Ethnicity

The table and graph below show the age-adjusted unintentional injury death rate per 100,000 population by ethnicity in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the rate among Hispanic residents rose from 40.3 per 100,000 in 2019 to 50.3 per 100,000 in 2020, and the rate among non-Hispanic residents rose from 65.8 per 100,000 in 2019 to 79.3 per 100,000 in 2020. The rate among Palm Beach County non-Hispanic residents was higher than the rate among every other ethnicity at the county and state level each year from 2016 to 2020.

## Deaths from Firearms Discharge

## Age-Adjusted Deaths from Firearms Discharge

The table and graph below show the age-adjusted firearm discharge death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. The death rate among Palm Beach County residents increased from 2017 ( 12.0 per 100,000) to 2019 ( 13.6 per 100,000), then decreased in 2020 ( 12.2 per 100,000 ). The rate among Florida residents overall in 2020 was 13.7 per 100,000, slightly above the county rate that same year.

The Healthy People 2030 national target is to reduce firearm-related deaths to 10.7 per 100,000 population. ${ }^{250} \mathrm{As}$ of 2020, Palm Beach County is not yet meeting this target with 12.2 per 100,000 population.

## Age-Adjusted Deaths from Firearms Discharge, By Race

This table and graph show the age-adjusted death rate per 100,000 population from firearms discharge in Palm Beach County and Florida from 2016 to 2020 by race. The rate among Palm Beach County White residents declined from 2019 ( 10.9 per 100,000) to 2020 ( 8.3 per 100,000), while the rate among Palm Beach County Black residents rose from 2019 ( 21.4 per 100,000 ) to $2020(22.9$ per 100,000). The rate among Palm Beach County Black residents was at least double the rate among White residents each year from 2016 to 2020, except 2019. Additionally, the rate among Palm Beach County Black residents was higher than rate among Florida Black residents overall each year, except most recently in 2020 when the rate among Florida Black residents was 23.2 per 100,000.

## Homicide Deaths

## Age-Adjusted Homicide Deaths

The table and graph below show the age-adjusted homicide death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. The rate among Palm Beach County residents fluctuated during this time frame and ultimately decreased from 7.6 per 100,000 in 2019 to 7.4 per 100,000 in 2020. Each year from 2016 to 2019, the rate among Palm Beach County residents was higher than the rate among Florida residents overall. However, in 2020, the rate among Palm Beach County residents ( 7.4 per 100,000) was lower than Florida residents (7.7 per 100,000) overall.

The Healthy People 2030 national target is to reduce homicides to 5.5 per 100,000. ${ }^{251}$ As of 2020, Palm Beach County was not yet meeting this target, with 7.4 per 100,000 population.

## Age-Adjusted Homicide Deaths, By Race

The following table and graph show the age-adjusted homicide death rate per 100,000 population by race in Palm Beach County and Florida from 2016 to 2020. Each year, there was a large disparity between the rate among Palm Beach County White and Black residents, with the rate among Black residents being at least five times higher than the rate among White residents. Most recently in 2020, the rate among Black residents in Palm Beach County was 22.7 per 100,000, while the rate among White residents was 2.5 per 100,000. Additionally, the rate among Black Palm Beach County residents was higher than the rate among Black Florida residents every year during this timeframe.

## Age-Adjusted Homicide Deaths, By Ethnicity

The table and graph below show the age-adjusted homicide death rate by ethnicity in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the death rate among non-Hispanic residents was higher than the rate among Hispanic residents every year during this timeframe. The rate among Palm Beach County Hispanic residents increased from 2016 ( 4.5 per 100,000) to 2019 ( 6.7 per 100,000), then decreased in 2020 ( 3.5 per 100,000 ). Alternatively, the rate among Palm Beach County non-Hispanic residents decreased from 2017 ( 9.8 per $100,000)$ to $2019(7.3$ per 100,000), then increased in $2020(8.9$ per 100,000).

## Drug-Poisoning Deaths

## Age-Adjusted Drug Poisoning Deaths

The table and graph below show the age-adjusted drug poisoning death rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. According to the Florida Department of Health, drug poisoning deaths include the intentional or unintentional overdose of a drug, being given the wrong drug, taking a drug inadvertently, or taking a drug in error ${ }^{252}$ The drug poisoning death rate among Palm Beach County residents increased from 30.5 per 100,000 in 2018 to 43.0 per 100,000 in 2020. The Palm Beach County rate was higher than the Florida rate each year during this timeframe.

There is no Healthy People 2030 national target directly associated with drug poisoning, but there is a national target to reduce drug overdose deaths to 20.7 per 100,000 population. ${ }^{253}$

## Deaths from Unintentional Falls

## Age-Adjusted Deaths from Unintentional Falls

The following table shows the age-adjusted death rate per 100,000 population from unintentional falls in Palm Beach County and Florida from 2016 to 2020. During this timeframe, the rate fluctuated overall but decreased most recently from 9.5 per 100,000 in 2019 to 8.6 per 100,000 in 2020. Additionally, the death rate among Palm Beach County residents was lower than the death rate among Florida residents overall every year from 2016 to 2020.

The Healthy People 2030 national target is to reduce the fall-related death rate among older adults ages 65 and over to 63.4 per 100,000 population. While the data below shows the age-adjusted death rate from unintentional falls for all ages, any decrease is progress towards a healthier community.

Table 274: Age-Adjusted Deaths from Unintentional Falls, Rate per 100,000 Population, Palm Beach County and Florida, 2016-2020

## Age-Adjusted Deaths from Unintentional Falls, By Race

The table and graph below show the age-adjusted death rate per 100,000 population from unintentional falls by race in Palm Beach County and Florida from 2016 to 2020. While the rate among Palm Beach County White and Black residents fluctuated slightly over this time period, both decreased from 2019 to 2020. The rate among Palm Beach County White residents decreased from 10.1 per 100,000 in 2019 to 9.3 per 100,000 in 2020, while the rate among Black residents decreased from 5.6 per 100,000 in 2019 to 3.5 per 100,000 in 2020.

## Age-Adjusted Deaths from Unintentional Falls, By Ethnicity

The following table and graph show the age-adjusted death rate per 100,000 population from unintentional falls by ethnicity in Palm Beach County and Florida from 2016 to 2020. The death rate among Palm Beach County nonHispanic residents was higher than the rate among Hispanic residents each year during this timeframe, except 2016. Most recently in 2020, the rate among Palm Beach County Hispanic residents was 6.5 per 100,000 population, and the rate among Palm Beach County non-Hispanic residents was 8.7 per 100,000 population in 2020.

[^218]
## Health Resource Availability and Access

The ability to access timely, quality health care services is considered a social determinant of health and an indicator of wellbeing in communities. Unfortunately, many people do not get the services they need due to availability, or lack thereof, of health care resources in a certain area.

According to the United States Census, approximately 1 in 10 individuals did not have health insurance coverage in 2020. ${ }^{254}$ People without health insurance are less likely to have a primary care provider, resulting in delayed care, less preventative health screenings, and, ultimately, worse health outcomes. Specialty healthcare services may be inaccessible due to lack of transportation, and necessary medication critical for treatment may be unaffordable, further exacerbating issues. ${ }^{255}$ These situations can lead people to utilize the emergency department as a primary source of care, creating a strain on the healthcare system by driving up healthcare costs and unnecessarily filling beds. In addition, the recent COVID-19 pandemic has caused patients to further delay care due to COVID-19 related concerns and many people lost healthcare coverage due to job loss during this time, both further exacerbating issues related to health care access.

This section explores the availability of health resources and associated factors in Palm Beach County to assess residents' ability to access healthcare and identify gaps or barriers that exist. Inequities in healthcare access can lead to disparities in health outcomes, so it is important to understand these factors related to Palm Beach County residents specifically in the community health assessment process. Data on Florida overall has been included for context. Included in this section is data on the following indicators: hospital utilization, health care provider supply, Federal Health Professional Shortage Areas (HPSAs), Federal Medically Underserved Areas/Populations (MUA/Ps), and health insurance.

[^219]
## Hospital Utilization

## Utilization by Principal Diagnosis Groupings

## Top Ten Principal Diagnosis Groupings for Inpatient Discharges

According to the Organisation for Economic Co-operation and Development, an inpatient discharge is the release of a patient who was formally admitted into a hospital for treatment and/or care and stayed for a minimum of one night. ${ }^{256}$ Generally, health complications treated in inpatient settings are often more complex and serious than health complications that are treated in outpatient settings.

The following table shows the top ten principal diagnosis groupings for inpatient discharges in Palm Beach County facilities in 2019. For Palm Beach County facilities, "Liveborn Infants, In Hospital" (4.9\%) was the most common principal diagnosis grouping for an inpatient discharge, with "Sepsis, Unspecified Organism" (4.1\%), "COVID-19" (3.4\%), and "Liveborn Infant, Outside of Hospital" ( $2.9 \%$ ) following in that order. Collectively, these top four principal diagnosis groupings accounted for $15.3 \%$ of all principal diagnoses in Palm Beach County facilities in 2019.

Table 277: Top Ten Principal Diagnosis Groupings for Inpatient Discharges, Palm Beach County Facilities, 2019

| Principal Diagnosis Group | Discharges |  |
| :--- | ---: | ---: |
|  | Count | Percent |
| Liveborn Infants, In Hospital | 8,491 | $4.9 \%$ |
| Sepsis, Unspecified Organism | 7,198 | $4.1 \%$ |
| COVID-19 | 5,932 | $3.4 \%$ |
| Liveborn Infant, Outside of Hospital | 5,043 | $2.9 \%$ |
| Pneumonia, Unspecified Organism | 2,583 | $1.5 \%$ |
| Acute kidney failure, unspecified | 2,281 | $1.3 \%$ |

## Top Ten Principal Diagnosis Groupings for Inpatient Discharges for Mental Health

The table below shows the top ten principal diagnosis groupings for inpatient discharges for mental health in Palm Beach County facilities in 2019. "Major depressive disorder, recurrent severe without psychotic features" (12.1\%) was the most common principal diagnosis grouping, followed by "Bipolar disorder, unspecified" (6.1\%), "Schizophrenia, unspecified" (4.5\%), and "Schizoaffective disorder, bipolar type" (4.3\%). Collectively, these top four diagnosis groupings accounted for $27.0 \%$ of all mental health-related inpatient discharge principal diagnoses in Palm Beach County facilities.

Table 278: Top Ten Principal Diagnosis Groupings for Inpatient Discharges for Mental Health, Palm Beach County Facilities, 2019

| Principal Diagnosis Group | Discharges |  |
| :--- | ---: | ---: |
|  | Count | Percent |
| Major depressive disorder, recurrent severe without psychotic features | 1,562 | $12.1 \%$ |
| Bipolar disorder, unspecified | 781 | $6.1 \%$ |
| Schizophrenia, unspecified | 583 | $4.5 \%$ |
| Schizoaffective disorder, bipolar type | 557 | $4.3 \%$ |
| Alcohol dependence with withdrawal, unspecified | 549 | $4.3 \%$ |
| Paranoid schizophrenia | 536 | $4.2 \%$ |

## Emergency Department Top Ten Principal Diagnosis Groupings

There were 130 million emergency department visits in the United States in 2018, with 12.4\% of those visits (16.2 million) requiring hospital admission. ${ }^{257}$ Of those visits, 16.2 million required hospital admission, and 2.3 million required critical care.

The table below shows the emergency department top ten principal diagnosis groupings in Palm Beach County facilities in 2019. In Palm Beach County, there were a total of 370,728 emergency department discharges reported. Among those, "Other Chest Pain" (2.8\%), "Acute Respiratory Infection" (2.4\%), and "COVID-19" $2.2 \%$ were the top three principal diagnosis groupings reported. Perhaps reflecting the wide range of unique diagnosis groupings available in emergency department settings, the top three principal diagnosis groupings for emergency departments in Palm Beach County accounted for only 7.4\% of all principal diagnoses at discharge.
Table 279: Emergency Department Top Ten Principal Diagnosis Groupings, Palm Beach County Facilities, 2019

| Principal Diagnosis Group | Discharges |  |
| :--- | ---: | ---: |
|  | Count | Percent |
| Other Chest Pain | 10,354 | $2.8 \%$ |
| Acute Respiratory Infection | 8,830 | $2.4 \%$ |
| COVID-19 | 8,309 | $2.2 \%$ |
| Other Disorders of the Urinary System | 6,808 | $1.8 \%$ |
| Chest Pain, Unspecified | 5,006 | $1.5 \%$ |
| Syncope and Collapse | 4,590 | $1.2 \%$ |

## Emergency Department Top Ten Principal Diagnosis Groupings for Mental Health

The table below shows the emergency department top ten principal diagnosis groupings for mental health in Palm Beach County facilities in 2019. "Anxiety disorder, unspecified" (18.15\%), "Alcohol abuse with intoxication, unspecified" (14.3\%), and "Major depressive disorder, single episode, unspecified" (7.2\%) were the three most common diagnosis groupings, accounting for $39.65 \%$ of all mental health related principal diagnoses.

Table 280: Emergency Department Top Ten Principal Diagnosis Groupings for Mental Health, Palm Beach County Facilities, 2019

| Principal Diagnosis Group | Discharges |  |
| :--- | ---: | ---: |
|  | Count | Percent |
| Anxiety disorder, unspecified | 2,387 | $18.15 \%$ |
| Alcohol abuse with intoxication, unspecified | 1,881 | $14.3 \%$ |
| Major depressive disorder, single episode, unspecified | 953 | $7.2 \%$ |
| Alcohol dependence with intoxication | 845 | $6.4 \%$ |
| Brief psychotic disorder | 530 | $4.0 \%$ |
| Panic disorder [Episodic Paroxysmal Anxiety] | 528 | $4.0 \%$ |
| Alcohol use, unspecified with intoxication, unspecified | 508 | $3.7 \%$ |
| Opioid abuse, uncomplicated | 452 | $3.4 \%$ |
| Other psychoactive substance abuse, uncomplicated | 438 | $3.3 \%$ |
| Generalized anxiety disorder | 432 | $3.3 \%$ |
| All Other Diagnoses | 4,197 | $31.9 \%$ |
| Total- All Principal Diagnoses | 13,151 | $100 \%$ |

## Hospital Emergency Department Utilization

Patients may elect to receive care in an emergency department setting because of the severity of a medical problem, or because of a lack of other viable options for care- often due to a lack of insurance, or because other sources of medical care are unavailable. Previous research has indicated that as high proportion of patients in an emergency department setting have resorted to the emergency room for medical care due to a lack of access to other sources of care. When looking at race and ethnicity, Black and Hispanic patients were significantly more likely to report visiting an emergency department for a persisting health condition compared to their White and non-Hispanic counterparts. ${ }^{258}$

## Hospital Emergency Department Utilization

The following table shows the hospital emergency department utilization in Palm Beach County from January to December 2020. As shown below, there were a total of 488,851 total emergency department visits in Palm Beach County in 2020. The most utilized hospital emergency department in the county was JFK Medical Center with 74,462 visits ( $15.2 \%$ ), followed by Delray Medical Center with 47,522 visits ( $9.7 \%$ ). No other center received more than 46,000 emergency department visits in 2020. Additionally, the lowest utilized hospital emergency departments were Bethesda Hospital West with 13,330 visits (2.7\%) and Lakeside Medical Center with 16,721 visits (3.4\%).

Table 281: Hospital Emergency Department Utilization, Palm Beach County, January-December 2020

| Facility Name | Visits |  |
| :--- | ---: | ---: |
| Bethesda Hospital East | 33,008 | $6.8 \%$ |
| Bethesda Hospital West | 13,330 | $2.7 \%$ |
| Boca Raton Regional Hospital | 43,631 | $8.9 \%$ |
| Delray Medical Center | 47,522 | $9.7 \%$ |
| Good Samaritan Medical Center | 32,833 | $6.7 \%$ |
| JFK Medical Center | 74,462 | $15.2 \%$ |

[^222]
## Adult Psychiatric Inpatient Utilization

As recent as 2015, staying overnight in a hospital or other inpatient setting was the least common type of mental health service that adults utilized. In 2015, 34.2 million adults aged 18 or older received mental health care during the past 12 months. Only 2.2 million adults, however, utilized inpatient services that same year. Approximately $1.4 \%$ of adults aged 18 to $26,0.9 \%$ of adults aged 26 to 49 , and $0.8 \%$ of adults aged 50 and older received inpatient mental health services in 2015. Increased access to mental health services in communities may reduce the need for inpatient mental health utilization. ${ }^{259}$

## Adult Psychiatric Inpatient Utilization

The table below shows the adult psychiatric inpatient utilization in Palm Beach County by facility from January to December 2020. During this timeframe, 268 beds were available for adult psychiatric inpatient use across all facilities in Palm Beach County. The facility with the highest total admissions was JFK Medical Center North Campus, which reported 3,948-accounting for 30\% of all adult psychiatric inpatient admissions in Palm Beach County in 2020.

Patient days refers to the total number of days a patient is treated in an inpatient setting. The facilities with the highest total number of patient days were JFK Medical Center North Campus $(20,228)$ and Delray Medical Center $(12,743)$. Those two centers also reported the highest occupancy rates in Palm Beach County, with $90.6 \%$ at JFK Medical Center North Campus and $87.4 \%$ at Delray Medical Center. The lowest occupancy rate was reported by Coral Shores Behavioral Health ( $36.5 \%$ ). When looking at the average length of adult psychiatric inpatient stay across Palm Beach County, Delray Medical Center reported the highest average length of stay at 12.4 days, while the lowest was reported by Saint Lucie Medical Center at 3.6 days.

Table 282: Adult Psychiatric Inpatient Utilization, Palm Beach County, January-December 2020

| Facility Name | Beds <br> Licensed | Occupancy <br> Rate | Admissions | Patient Days | Avg <br> Length of <br> Stay <br> (Days) |

[^223]
## Mental Health Hospital Utilization

According to the Substance Abuse and Mental Health Services Administration, in the United States, overall mental health service utilization was highest among White adults ( $18.3 \%$ ), followed by adults reporting two or more races (17.6\%), American Indian or Alaska Native (14.4\%), Black (8.9\%), Hispanic (8.7\%), Native Hawaiian or Pacific Islander ( $6.9 \%$ ), and Asian ( $5.9 \%$ ) adults. ${ }^{260}$ Regarding outpatient mental health services, the highest utilization rates were reported among adults reporting two or more races (10.2\%), followed by White (9.0\%), American Indian or Alaska Native (7.6\%), Black ( $5.0 \%$ ), and Asian ( $3.8 \%$ ) adults. Additionally, females were more likely than males to utilize mental health outpatient services. White males utilized mental health services more than males of all other races, and White females also reported higher mental health service utilization than females of all other races. For every age group, White adults were more likely to use mental health services than adults of all other races. Socioeconomic and environmental factors, including access to insurance and available transportation, and the mental health impacts resulting from the COVID-19 pandemic, all contribute to these disparities.

Healthy People 2030 has not set a national target for mental disorder hospital or emergency department utilization, but does have a national target to increase the proportion of people with substance use and mental health disorders who get treatment to $8.2 \%$. ${ }^{261}$

[^224]
## Mental Disorder Emergency Department Utilization, By Race

The table below shows the total number of mental disorder emergency department diagnoses by race in Palm Beach County in 2019. Of all races, White patients attributed to 38,141 (66.6\%) total mental disorder diagnoses in 2019, followed by Black or African American patients with 13,014 (22.7\%) diagnoses.

Healthy People 2030 has not set a national target for mental disorder emergency department utilization.
Table 283: Mental Disorder Emergency Department Utilization, By Race, Palm Beach County, 2019

| Race | Principal <br> Diagnosis | Other Diagnosis <br> $1-3$ | Total | \% of Total |
| :--- | ---: | ---: | ---: | ---: |
| American Indian or Alaska Native | 6 | 20 | 26 | $0.05 \%$ |
| Asian | 70 | 175 | 245 | $0.43 \%$ |

| Total | 13,151 | 44,101 | 57,252 | $100 \%$ |

[^225]
## Mental Disorder Inpatient Utilization, By Race

Nationally, inpatient mental health utilization was higher among Black adults (1.5\%) than among White (0.8\%), and Asian ( $0.6 \%$ ) adults. ${ }^{262}$ Differences in insurance coverage or type of insurance contribute to these disparities. For example, Medicaid use is associated with higher inpatient service use, and a lack of insurance may contribute to delays in receiving mental health care services until the severity of the condition necessitates inpatient services.

The table below shows the total number of mental disorder inpatient diagnoses by race in Palm Beach County in 2019. During that year, White patients ( $67.2 \%$ ) received the highest number of inpatient mental disorder diagnoses, followed by Black or African American patients (22.6\%).
Table 287: Mental Disorder Inpatient Utilization, By Race, Palm Beach County, 2019

| Race | Principal <br> Diagnosis | Other <br> Diagnosis <br> $1-3$ | Total | \% of Total |
| :--- | ---: | ---: | ---: | ---: |
| American Indian or Alaska Native | 16 | 17 | 33 | $0.09 \%$ |
| Asian | 87 | 126 | 213 | $0.56 \%$ |
| Black or African American | 3,317 | 5,311 | 8,628 | $22.6 \%$ |
| Native Hawaiian or Other Pacific Islander | 0 | 4 | 4 | $0.01 \%$ |

## Health Care Facility Capacity

Hospital Beds

According to the Florida Department of Health, the number of hospital beds indicates the number of people who may potentially receive care in the hospital on an in-patient basis. ${ }^{265}$ Looking at numbers of professionals or facilities within a geographic area helps to focus on the availability of health care and its quality.

## Total Hospital Beds

The table below shows the rate per 100,000 population of hospital beds in Palm Beach County and Florida. This rate has gradually decreased in the county and in the state overall. In 2016, the rate in Palm Beach County was 298.9 per 100,000 population and it decreased to 295.0 per 100,000 population in 2020.

Table 291: Total Hospital Beds, Rate Per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Rate | Count | Rate |
| 2016 | 4,170 | 298.9 | 63,209 | 312.4 |
| 2017 | 4,223 | 299.3 | 64,197 | 312.3 |
| 2018 | 4,223 | 292.8 | 64,585 | 308.2 |

[^228]
## Nursing Home Beds

According to the Florida Department of Health, the number of nursing home beds indicates the number of people who may potentially receive residential nursing home care. ${ }^{266}$ With a large population of individuals 65 and older in Palm Beach County this is an essential indicator to understand the county's capacity to provide quality care to a growing population of older individuals.

## Total Nursing Home Beds

The table below shows the rate of nursing home beds per 100,000 population in Palm Beach County and Florida from 2016 to 2020. In Palm Beach County, the rate of nursing home beds gradually decreased from 455.5 beds per 100,000 population in 2016 to 418.9 beds per 100,000 population in 2020 . This decreasing trend is similar to the trend seen at the state level during this period.

Table 292: Total Nursing Home Beds, Rate Per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Rate | Count | Rate |
| 2016 | 6,355 | 455.5 | 83,611 | 413.3 |
| 2017 | 6,349 | 449.9 | 83,782 | 407.6 |
| 2018 | 6,349 | 440.2 | 83,779 | 399.8 |
| 2019 | 6,329 | 433.9 | 85,470 | 401.9 |

## Adult Psychiatric Beds

When people in psychiatric distress are uninsured, charged with crimes, or meet the state criteria for civil commitment because they are violent or dangerous to themselves or others, psychiatric beds are where they are admitted for treatment. According to the Florida Department of Health, the number of psychiatric beds indicates the number of people who may potentially receive adult (age 18 and over) psychiatric care on an in-patient basis. ${ }^{267}$

## Adult Psychiatric Beds

The table below shows the rate of adult psychiatric beds per 100,000 population for Palm Beach County and Florida from 2016 to 2020. The rate of adult psychiatric beds in Palm Beach County decreased each year from 2017 (16.8 per 100,000 ) to $2020(15.6$ per 100,000$)$. Additionally, the rates at the county level were lower than the rates at the state level every year reported during this timeframe.

Table 293:Adult Psychiatric Beds, Rate Per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Rate | Rount |

## Child \& Adolescent Psychiatric Beds

According to the Florida Department of Health, the number of child or adolescent beds indicates the number of people who may potentially receive child or adolescent (age less than 18) psychiatric care on an in-patient basis. ${ }^{268}$

## Child and Adolescent Psychiatric Beds

The table below shows the number of child and adolescent psychiatric beds per 100,000 population for Palm Beach County and Florida from 2016 to 2020. During this timeframe, the rate of child and adolescent psychiatric beds in Palm Beach County remained consistent from 2016 to 2019 ( 1.9 per 100,000), then increased in 2020 ( 2.7 per 100,000 ). Each year, the rate at the county level was lower than the rate at the state level.

Table 294: Child and Adolescent Psychiatric Beds, Rate Per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Rate |  |
| 2016 | 27 | 1.9 | 545 | Rate |
| 2017 | 27 | 1.9 | 516 | 2.7 |
| 2018 | 27 | 1.9 | 644 | 2.5 |

## Adult Substance Use Beds

According to the Florida Department of Health, the number of adult substance abuse beds indicates the number of adults (age 18 and over) who may receive substance abuse treatment on an in-patient basis. ${ }^{269}$

## Adult Substance Abuse Beds

The following table shows the rate of adult substance abuse beds per 100,000 population in Palm Beach County and Florida from 2016 to 2019. In Palm Beach County, the rate was 0.4 beds per 100,000 population in 2016 and 2017, then declined to 0.3 per 100,000 population in 2018 where it remained in 2019 and 2020. The rate in Palm Beach County was lower than the rate in Florida each year during this timeframe. This indicates that, although the population has increased, the number of substance abuse beds had not increased to meet this need.

Nurses

## Student-Nurse Ratio in Schools Grades PreK - 12

The following table shows the student to nurse ratio in schools from Pre-K to $12^{\text {th }}$ grade in Palm Beach County and Florida from 2016 to 2020. This ratio indicates how many Pre-K to $12^{\text {th }}$ grade students school each nurse is responsible for. The Palm Beach County ratio increased from 2016 ( 854.5 students per school nurse) to 2019 (906.6 students per school nurse), then declined in 2020 ( 886.9 students per school nurse).

Table 300: Student-Nurse Ratio in Schools Grades PreK - 12, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County <br> Ratio |  |  |
| :--- | :---: | :---: | :---: |
|  | 854.5 | Florida |  |
| 2017 | 885.3 | Ratio |  |
| 2018 | 872.6 | $2,410.0$ |  |
| 2019 | 906.6 | $2,381.5$ |  |
| 2020 | 886.9 | $2,392.7$ |  |

## Advanced Registered Nurse Practitioners (ARNPs)

This table shows the rate per 100,000 of Advanced Registered Nurse Practitioners, or ARNPs, in Palm Beach County and Florida from 2016 to 2020. The rate of ARNPs in Palm Beach County increased steadily from 2016 (95.5 per 100,000 ) to 2020 ( 193.3 per 100,000). However, the Palm Beach County rate was lower than the Florida rate each year reported.

Table 301: Advanced Registered Nurse Practitioners, Rate per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Rate | Count |
| 2016 | 1333 | 95.5 | 20310 | 100.4 |

## Clinical Nurse Specialists

The table below shows the rate per 100,000 of Clinical Nurse Specialists in Palm Beach County and Florida from 2016 to 2020. The rate in Palm Beach County remained steady from 2016 to 2018 at 0.3 per 100,000, then increased in 2019 to 1.1 per 100,000 where it remained in 2020. The rate of Clinical Nurse Specialists in Palm Beach County was lower than the rate in Florida during each year from 2016 to 2020.

Table 302: Clinical Nurse Specialists, Rate per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year |  | Palm Beach County |  | Florida |  |

## Licensed Practical Nurses (LPNs)

The table below shows the rate per 100,000 of licensed practical nurses, or LPNs, in Palm Beach County and Florida from 2016 to 2020. Most recently, the rate declined in Palm Beach County from 246.7 per 100,000 population in 2019 to 224.7 per 100,000 population in 2020. The rate of LPNs in Palm Beach County was lower than the rate in Florida each year during this timeframe.

Table 303: Licensed Practical Nurses, Rate per 100,000 Population, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |

## Behavioral and Mental Health Providers

## Licensed Clinical Social Workers (LCSWs)

The table below shows the rate per 100,000 of Licensed Clinical Social Workers, or LCSWs, in Palm Beach County and Florida from 2016 to 2020. The Palm Beach County rate of LCSWs increased each year from 2017 ( 69.3 per $100,000)$ to $2020(81.9$ per 100,000$)$. Additionally, the rate in Palm Beach County far exceeded the rate in Florida each year during the reported timeframe.

Table 305: Licensed Clinical Social Workers, Rate per 100,000 Population, Palm Beach County and Florida, 20162020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |

## Federal Health Professional Shortage Area (HPSA)

Health Professional Shortage Areas, or HPSAs, are geographic areas, populations, or facilities that have a shortage of primary, dental, or mental health care providers. HPSAs are designated by the Health Resources Services Administration (HRSA) and are eligible to receive certain federal resources with the aim of improving access to health care services in under-resourced communities. ${ }^{270}$

Each HPSA receives a score based on certain common criteria, including the population-to-provider ratio, percent of population below $100 \%$ of the Federal Poverty Level (FPL), and travel time to the nearest source of care outside of the HPSA designation area. Additional criteria are used for HPSA scoring for each of the primary care, dental, and mental health areas. Scores can range from 0 to 25 for Primary Care and Mental Health and from 0 to 26 for Dental Health. The greater the score, the greater the need. ${ }^{271}$

Looking at the tables, the HPSA FTE Short refers to the number of full-time equivalent (FTE) practitioners needed to achieve the population to practitioner target ratio in that HPSA. ${ }^{272}$

## Primary Care Health

## Primary Care Health Professional Shortage Areas

The table below shows the Primary Care Health Professional Shortage Areas in Palm Beach County as of October 2021. There were 9 total Primary Care HPSA designations in Palm Beach County. As previously mentioned, Primary Care areas can receive a score between 0 and 25 . This figure below shows the Primary Care HPSA scoring process.

Figure 181: Primary Care HPSA Scoring

Source: Health Resources and Services Administration, Scoring Shortage Designations, 2021

As can be seen on Table 309, with HPSA scores of 21 each, the highest need areas included Genesis Community Health, Inc. and the Health Care District of Palm Beach County, which are both Federally Qualified Health Center facilities. Additionally, Florida Community Health Centers, Inc. and FoundCare, Inc. both had HPSA scores of 19, and the Low Income Population HPSA of Lantana/Lake Worth had a HPSA score of 18.

[^233]Table 309: Primary Care Health Professional Shortage Areas, Palm Beach County, As of October 2021

| HPSA Name | Designation Type | HPSA FTE Short | HPSA Score | Rural Status |
| :---: | :---: | :---: | :---: | :---: |
| Boca Raton | Low Income Population HPSA | 0.77 | 13 | NonRural |
| Belle Glade/Pahokee | Low Income Migrant Farmworker Population HPSA | 4.942 | 15 | Rural |

## Dental Health Care

## Dental Health Professional Shortage Areas

The table below shows the Dental Health Professional Shortage Areas in Palm Beach County as of October 2021. There were 7 total designated areas in Palm Beach County. As previously noted, Dental HPSAs can receive a HPSA score between 0 and 26 . The following table shows the Dental HPSA scoring process.

Figure 182: Dental HPSA Scoring

Source: Health Resources and Services Administration, Scoring Shortage Designations, 2021
The highest need areas included Florida Community Health Centers, Inc (HPSA Score 26), FoundCare, Inc. (HPSA Score 25), Genesis Community Health, Inc. (HPSA Score 25), and the Health Care District of Palm Beach County (HPSA Score 25), all of which were Federal Qualified Health Center facilities. The Low Income Population HPSA rural area of Belle Glade was not far behind with a score of 23 . Five of the seven areas had HPSA scores over 20.

Table 310: Dental Health Professional Shortage Areas, Palm Beach County, As of October 2021

| HPSA Name | Designation Type | HPSA FTE Short | HPSA Score | Rural Status |

## Mental Health Care

## Mental Health Professional Shortage Areas

The table below shows the Mental Health Professional Shortage Areas in Palm Beach County as of October 2021. There were 6 total designated areas in Palm Beach County. As previously mentioned, Mental HPSAs can have a score between 0 and 25 . Below is a figure showing the score process for Mental HPSAs.

Figure 183: Mental HPSA Scoring

Source: Health Resources and Services Administration, Scoring Shortage Designations, 2021
FoundCare, Inc., a Federally Qualified Health Center, had the highest HPSA score of 23. Florida Community Health Centers, Inc. had a score of 22 and Genesis Community Health, Inc. had a score of 20, both of which are also Federally Qualified Health Center facilities.

## Federal Medically Underserved Areas/Populations

Federal Medically Underserved Areas/Populations (MUA/P) designate areas and populations with a lack of access to primary care services and help establish health maintenance organizations or community health centers. MUAs have a shortage of primary care services within a geographic area, such as a county, group of counties, or an urban census tract. MUPs have a specific population subset facing barriers to health care within a geographic area, such as people who are experiencing homelessness or migrant farm workers. ${ }^{273} \mathrm{HPSAs}$ are designated by the Health Resources Services Administration (HRSA) and are therefore eligible to receive certain federal resources with the goal of improving access to health care services in under-resourced communities. ${ }^{274}$

Each MUA/P receives an Index of Medical Underservice (IMU) score calculated for the designated area or population. An area or population with an IMU score of 62.0 or below qualifies that area or population as a MUA/P, and scores can be between 0 and 100. The following figure shows the score process for MUA/Ps.

Figure 184: MUA/P Scoring

Source: Health Resources and Services Administration, Scoring Shortage Designations, 2021

## Federal Medically Underserved Populations and Areas

The following table shows the Federal Medically Underserved Populations and Areas in Palm Beach County as of October 2021. There were 8 total designated populations and areas throughout the county. The two lowest IMU scores were given to Low Inc - Delray Beach with a score of 46.7 and Low Inc - Greenacres with a score of 47.5 .

Table 312: Federal Medically Underserved Populations and Areas, Palm Beach County, As of October 2021

| Service Area Name | MUA/P <br> ID | Index of Medical Underservice <br> Score | Rural <br> Status | Designation <br> Date |

[^234]
## Health Insurance

Previous research suggests that having health insurance is a key determinant of being able to access routine, preventative, and comprehensive healthcare, which ultimately impacts health outcomes and risk of mortality. ${ }^{275} \mathrm{~A}$ number of the leading causes of disability and disease can be prevented through early detection, which makes increasing health insurance coverage very important. While health insurance is only one factor mediating access to healthcare, it is crucial to improving the quality of life and achieving health equity in under-resourced communities. The COVID-19 pandemic led to increased rates of unemployment and economic uncertainty. As a result, consideration should be given to future data related to the indicators presented in this section, as employment and health insurance coverage are often intertwined. Early research shows that one of five adults who reported that they or a spouse/partner had health insurance coverage through a job affected by COVID-19 also reported that at least one of them is now uninsured because of the impact. As additional research is conducted related to health insurance and the COVID-19 pandemic, public health professionals and local leaders should continue to review the connections between the COVID-19 pandemic and health insurance coverage in the community. ${ }^{276}$

Insured

## Adults with Any Type of Health Care Insurance Coverage

The following table shows the percentage of adults with any type of health care insurance coverage in Palm Beach County and Florida in 2007, 2010, 2013, 2016, and 2019. While the percentage in Palm Beach County fluctuated during those years, it was higher than the overall state percentage each year. In 2019, 85.5\% of Palm Beach County residents had any type of health insurance coverage compared to $84.2 \%$ of Florida residents.

Table 313: Adults with Any Type of Health Care Insurance Coverage, Palm Beach County and Florida, 2007, 2010, 2013, 2016, 2019

| Year | Palm Beach County | Florida |
| :--- | ---: | ---: |
| 2007 | $83.4 \%$ | $81.4 \%$ |
| 2010 | $89.7 \%$ | $83.0 \%$ |
| 2013 | $79.7 \%$ | $77.1 \%$ |
| 2016 | $85.8 \%$ | $83.7 \%$ |
| 2019 | $85.5 \%$ | $84.2 \%$ |

## Health Insurance Coverage for Individuals with Disabilities, By Age

The table below shows the percentage of individuals with disabilities who have health insurance coverage by age in Palm Beach County and Florida in 2019. In Palm Beach County, 30.5\% of individuals ages 65 and older had a disability, which was the largest proportion of any age group reported. Of those individuals, $99.0 \%$ had health insurance coverage. The largest population of disabled individuals without health insurance coverage were those ages 19 to 64 , with $15.9 \%$ reporting having no health insurance coverage in 2019. This was higher than the state percentage of $14.9 \%$ of disabled individuals with no health insurance coverage ages 19 to 64 in 2019.

## Uninsured

## Uninsured Individuals, By Age and Gender

This table shows the percentage of uninsured individuals by age and gender in Palm Beach County in 2019. Those ages 19 to 25 had the highest uninsured percentage ( $23.7 \%$ ), and those ages 65 and older had the lowest percentage (1.3\%). Males ( $14.6 \%$ ) were more likely be uninsured than females (11.6\%).

Table 315: Uninsured Individuals, By Age and Gender, Palm Beach County, 2019

|  | Total | Number Uninsured | Percent Uninsured |  |
| :--- | ---: | ---: | ---: | :---: |
| Civilian noninstitutionalized population | $1,451,973$ | 189,280 | $13.0 \%$ |  |
| Age | 298,678 | 24,527 | $8.2 \%$ |  |
| Under 19 years | 113,286 | 26,845 | $23.7 \%$ |  |
| 19 to 25 years | 812,011 | 160,172 | $19.7 \%$ |  |
| 19 to 64 years | 341,284 | 4,581 | $1.3 \%$ |  |
| 65 years and older |  |  |  |  |
| Sex | 701,016 | 102,323 | $14.6 \%$ |  |
| Male | 750,957 | 86,957 | $11.6 \%$ |  |
| Female |  |  |  |  |

Note: Beginning in 2017, selected variable categories were updated, including age-categories, income-to-poverty ratio (IPR) categories, and the age universe for certain employment and education variables

## Uninsured Individuals, By Census County Division (CCD)

The following table shows the percentage of uninsured individuals in Palm Beach County by Census County Division (CCD) in 2019. The CCD with the largest percentage of uninsured individuals was the Lake Worth CCD with $23.6 \%$ of the total population uninsured. Of the individuals in the Lake Worth CCD, 60.0\% ages 19 to 64 and $24.2 \%$ under 19 years of age were uninsured. The Belle Glade-Pahokee CCD also had the second largest percentage of uninsured individuals (21.9\%). Of the individuals in the Belle Glade-Pahokee CCD, 57.2\% ages 19 to 64 and 30.1\% under 19 years of age were uninsured. The highest percentage of those 65 years and older that were uninsured was found in the Boca Raton CCD (31.4\%) and Boynton Beach-Delray Beach CCD (31.4\%).

Table 317: Uninsured Individuals, By Census County Division, Palm Beach County, 2019

|  | Percent of Total Population Uninsured |  |  |  |
| :--- | ---: | ---: | ---: | ---: |

## Medicaid

## Median Monthly Medicaid Enrollment

The table below shows the median monthly Medicaid enrollment rate per 100,000 population in Palm Beach County and Florida from 2016 to 2020. For each year reported, the rate among Palm Beach County residents was lower than the rate among state residents overall. Notably, the rate among Palm Beach County residents increased most recently from $2019(14,618.5$ per 100,000$)$ to $2020(16,845.3$ per 100,000$)$. However, this rate was much lower than the rate of 19,940.0 per 100,000 among Florida residents overall in 2020.

Table 318: Median Monthly Medicaid Enrollment, Palm Beach and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count | Rate | Count | Rate |
| 2016 | 227,748 | $16,324.7$ | $3,979,899$ | $19,672.2$ |
| 2017 | 235,972 | $16,723.1$ | $4,030,447$ | $19,607.4$ |
| 2018 | 218,511 | $15,150.4$ | $3,846,917$ | $18,355.6$ |
| 2019 | 213,222 | $14,618.5$ | $3,766,453$ | $17,709.0$ |
| 2020 | 247,609 | $16,845.3$ | $4,315,244$ | $19,940.4$ |

## Children's Health Insurance Program (CHIP)

The Children's Health Insurance Program (CHIP) was established by the federal government in 1997 with the goal of providing health insurance coverage to uninsured children who are low-income and are not eligible for Medicaid. According to the Kaiser Family Foundation, children enrolled in state CHIPs have experienced increased access to care, utilization, and financial protection during economic downturns. Additionally, evidence suggests that children with Medicaid and CHIP have improved health, leading to better performance in school, which ultimately has positive implications for the overall economy. ${ }^{277}$

The CHIP provides federal funding to states for designing and regulating their state's CHIP program for low-income families. In Florida, Florida Healthy Kids, MediKids, and Children's Medical Services (CMS) make up the state's CHIP program. ${ }^{278}$

## Children's Health Insurance Programs

## Children's Health Insurance Program Total Enrollment by Program

The following table shows the total enrollment numbers for the Children's Health Insurance Program (CHIP) in Palm Beach County as of August 2021.

Table 319: Children's Health Insurance Program Total Enrollment by Program, As of August 2021

## Medikids

## Children Under Five Covered by MediKids

The table below shows the percentage of children under 5 years of age covered by MediKids in Palm Beach County and Florida from 2016 to 2020. During this timeframe the percentage of children in Florida under age 5 covered by MediKids was higher than the Florida percentage, except for in 2019. Most recently, $3.2 \%$ of children under 5 years of age in Palm Beach County were covered, while $2.7 \%$ were covered in Florida overall.

Table 322: Children Under 5 Covered by Medikids, Palm Beach County and Florida, 2016-2020

| Year | Palm Beach County |  | Florida |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Count |  | Percent | Count |
| 2016 | 2,105 | $2.9 \%$ | 29,757 | $2.7 \%$ |
| 2017 | 2,313 | $3.2 \%$ | 31,496 | $2.8 \%$ |

## Federally Qualified Health Centers (FQHC)

Federally Qualified Health Centers are community-based health care providers that receive funds from the HRSA Health Center Program to provide primary care services in underserved areas. They must meet a stringent set of requirements, including providing care on a sliding fee scale based on ability to pay, and must operate under a governing board that includes patients. ${ }^{279}$

## Federally Qualified Health Centers

The table below shows the Federally Qualified Health Centers in Palm Beach County as of 2021. There are five federally qualified health centers that serve the county.

Table 323: Federally Qualified Health Centers, Palm Beach County, 2021

## Food Access

Low food access is defined as being far from a supermarket, supercenter, or large grocery store. A census tract has low access status if there are at least 500 people or 33 percent of the population within the tract with low access. Low-income census tracts are defined as where the tract's poverty rate is greater than 20 percent, or where the tract's median family income (MFI) is less than or equal to 80 percent of the statewide MFI, or where the tract is in a metropolitan area and has an MFI less than or equal to 80 percent of the metropolitan area's MFI.

The figure below shows the low income, low food access census tracts in Palm Beach County based on 2019 data. In 2019, 23\% (77) of census tracts were low income and low foods access census tracts.

To view an interactive map of Low Food Access and Low-Income Census tracts, visit: https://public.tableau.com/views/LowIncomeLowFoodAccess/LlandLFADash?:Ianguage=enUS\&:display count=n\&:origin=viz share link

Figure 186: Low Income, Low Food Access Census Tracts, Palm Beach County, 2019

Low Income, Low Food Access Census Tracts, Palm Beach County, 2019

## Community Needs Index

The Community Needs Index (CNI) aggregates five factors associated with health needs: income, culture/language, education, housing status, and insurance coverage. A score of 1.0 indicates a ZIP Code with the lowest socioeconomic barriers (low need), while a score of 5.0 represents a ZIP Code with the most socioeconomic barriers (high need). The CNI captures multiple social determinants of health and highlights geographic areas that have significant disparities regarding access to healthcare services. Catholic Healthcare West found that residents of communities with the highest CNI scores were twice as likely to be hospitalized for conditions that can be managed in the primary or specialty care setting compared to communities with the lowest CNI scores. ${ }^{280}$ Some of these conditions include asthma, pneumonia, or congestive heart failure.

The figure below shows the CNI by ZIP code in Palm Beach County in 2020. In 2020, 38\% (20) census tracts were high need ZIP codes with a CNI score of 4.0 of higher.

To view an interactive map of the Community Needs Index, visit:

[^238]
## Child Opportunity Index

The Child Opportunity Index (COI) measures and maps the quality of resources and conditions that affect whether children grow up healthy in the neighborhoods where they live. This index combines data from 29 neighborhood-level indicators into a single composite measure. ${ }^{281}$ Child Opportunity Scores are on a scale from 1 (lowest) to 100 (highest). Scores are then grouped into 'very low,' 'low,' 'moderate,' 'high', and 'very high'.

The figure below shows the COI in Palm Beach County from 2015 to 2020. The majority of Palm Beach County Zip codes scored high or very high. However, 28\% of ZIP codes scored Low or Very Low. These ZIP codes were primarily located in the Glades Region of Palm Beach County, Lake Worth, and West Palm Beach.

To view an interactive map of the Child Opportunity Index, visit: https://public.tableau.com/views/ChildOpporunitylindex/COIDash?:language=enUS\&:display count=n\&:origin=viz share link

[^239]
## Social Vulnerability Index

Social vulnerability refers to populations that are particularly vulnerable to disruption and health problems as a result of natural disasters, human-made disasters, climate change, and extreme weather. The social vulnerability index (SVI) was designed to help identify areas where residents are in greatest need of support and recovery assistance in the case of a disaster or extreme weather event. The index is comprised of four categories of vulnerabilitysocioeconomic status, household composition and disability, minority status and language, and housing and transportation. The four social vulnerability levels-Low, Low to Moderate, Moderate to High, and High—are defined by dividing all tracts or counties in the country into quantiles based on the SVI. ${ }^{282}$

The following figure shows the SVI by census tract in Palm Beach County in 2018. In 2018, nearly a quarter (80) census tracts had a high SVI, followed by $19 \%$ (64) that had a moderate social vulnerability index. Census tracts with a moderate or high SVI were concentrated in the Glades Region, West Palm Beach, and Lake Worth.

To view an interactive map of the Social Vulnerability Index, visit: https://public.tableau.com/views/SocialVulnerabilitylIndex_16367561389920/SVIDash?:Ianguage=enUS\&:display_count=n\&:origin=viz_share_link

## Community Perspective

The community perspective is a valuable and critical component of the Community Health Assessment process. The Health Council of Southeast Florida utilized numerous strategies to gain the perspectives and experiences of community members and leaders, including the Local Public Health System Assessment, community focus groups, and key informant interviews. The primary, qualitative data gained from these strategies gave a platform for residents' and community leaders' voices to be heard and included in the countywide assessment. This purpose of this portion of the report was to collect the thoughts, opinions, concerns, and experiences from a diverse and representative group of constituents, including stakeholders and residents.

## Local Public Health System Assessment

## Background

In January 2022, the Health Council of Southeast Florida facilitated the Local Public Health System Assessment (LPHSA) in Palm Beach County utilizing the standardized National Public Health Performance Standards (NPHPS) tools. The LPHSA efforts are intended to analyze and improve the practice of public health and the performance of public health systems. The NPHPS were developed by the Centers for Disease Control and Prevention (CDC), American Public Health Association (APHA), Association of State and Territorial Health Officials (ASTHO), National Association of County and City Health Officials (NACCHO), National Association of Local Boards of Health (NALBOH), National Network of Public Health Institutes (NNPHI), and the Public Health Foundation (PHF).

The NPHPS tool is used to guide state and local jurisdictions in evaluating the performance of their public health system against a set of optimal or model standards. This assessment helps local public health systems determine how well their system addresses various components of the 10 Essential Services and accompanying Model Standards, answering questions such as "What are the components, activities, competencies, and capacities of our public health system?" and "How well are the 10 Essential Public Health Services being provided in our system?" The insight gained from this assessment can help local public health systems identify and address areas for improvement, ensuring that the local public health system is meeting the needs of residents, partners, and stakeholders to improve the health of the community.

The 10 Essential Public Health Services that are referenced throughout the assessment are as follows:

1. Monitor health status to identify and solve community health problems
2. Diagnose and investigate health problems and health hazards in the community
3. Inform, educate, and empower people about health issues
4. Mobilize community partnerships to identify and solve health problems
5. Develop policies and plans that support individual and community health efforts
6. Enforce laws and regulations that protect health and ensure safety
7. Link people to needed personal health services and assure the provision of health care when otherwise unavailable
8. Assure a competent public and personal health care workforce
9. Evaluate effectiveness, accessibility, and quality of personal and population-based health services
10. Research for new insights and innovative solutions to health problems

The primary purpose of the National Public Health Performance Standards (NPHPS) Local Public Health System Assessment (LPHSA) is to promote continuous improvement through performance evaluation of the current local public health system. In the context of this Community Health Assessment, the LPHSA assessment was used as a tool to:

1. Better understand current system functioning and performance;
2. Identify and prioritize areas of strengths, weaknesses, and opportunities for improvement;
3. Articulate the value that quality improvement initiatives will bring to the public health system;
4. Develop an initial work plan with specific quality improvement strategies to achieve goals;
5. Begin taking action achieving performance and quality improvement in one or more targeted areas; and
6. Re-assess the progress of improvement efforts at regular intervals

## Methodology

The Local Public Health System Assessment was conducted over the course of two meetings. On January 18, 2022, 14 internal stakeholders of the Florida Department of Health in Palm Beach County and the Health Care District of Palm Beach County gathered together to assess Essential Services 1, 2, 5, 6, and 10. On January 28, 2022, 56 external stakeholders and 6 members of the Florida Department of Health in Palm Beach County and the Health Care District of Palm Beach County assessed Essential Services 3, 4, 7, 8, and 9.

Over the course of these two meetings, the Palm Beach County local public health system partners assessed the performance of the public health system in Palm Beach County, relative to the national standards set by the National Public Health Performance Standards. Activities of all public health system partners and agencies that contribute to the local public health system, including public, private, and nonprofit entities, were assessed. Attendees were asked to evaluate the performance of the local public health system in each of the 10 Essential Public Health Services. The scores ranged from a minimum value of $0 \%$ (indicating that no level of activity is performed in the local public health system pursuant to the standards) to a maximum of $100 \%$ (indicating that all activities associated with the standards are performed at optimal levels). Each scoring measure represented a range, as depicted in Figure 190 below. Each participant was asked to vote in real time on the local public health system's performance in each Model Standard through a Zoom poll, and results were displayed instantly after each vote. The final score for each Model Standard was captured by majority vote or consensus in the responses. In some instances, participant responses were tied. In these cases, further discussion was facilitated among attendees and a re-vote was conducted to reach a consensus. At the end of both sessions, each Essential Service was ultimately given a composite score, determined by the aggregation of the scores given to individual Model Standards that contribute to each Essential Service area.

In addition to the LPHSA standard performance score assessment, the Internal LPHSA group, made up of staff from the Florida Department of Health in Palm Beach County and the Health Care district of Palm Beach County, was asked to complete an additional Local Health Department (LHD) Contribution Questionnaire. This additional assessment asked participants to consider the contribution of the local health department to each Model Standard. The External LPHSA group, made up of a variety of community stakeholders and leaders, was asked to complete an additional Priority of Model Standards Questionnaire. This additional assessment asked participants to prioritize the importance of each Model Standard in the community. These two optional NPHPS questionnaires serve as additional 2022 Palm Beach County, Florida Community Health Assessment

398 | Page
indicators of the local public health system's performance in each Essential Service area and provide deeper analysis of the local public health system in Palm Beach County. The results from these additional assessments were recorded in the NPHPS assessment score sheet and compiled using the report tool from NACCHO/CDC. The following assessment includes aggregate data from all questionnaires and assessments used throughout the LPHSA process.

The table below shows the response options that participants were given in their effort to evaluate each Model Standard throughout the Local Public Health System Assessment.

Figure 190: LPHSA Performance Measure Response Options

| Optimal Activity <br> $(76-100 \%)$ | Greater than $75 \%$ of the activity described within the <br> question is met. |
| :---: | :---: |
| Significant Activity <br> $(51-75 \%)$ | Greater than $50 \%$, but no more than $75 \%$ of the activity <br> described within the question is met. |
| Moderate Activity <br> $(26-50 \%)$ | Greater than $25 \%$, but no more than $50 \%$ of the activity <br> described within the question is met. |
| Minimal Activity <br> $(1-25 \%)$ | Greater than zero, but no more than $25 \%$ of the activity <br> described within the question is met. |
| No Activity <br> $(0 \%)$ | $0 \%$ or absolutely no activity. |

## Data Limitations

Potential data limitations are associated with this assessment process. Community health partners must understand these potential limitations and how to appropriately interpret results to effectively evaluate and improve the local public health system. While these scores provide an overarching view of the strengths, weaknesses, and opportunities within the Palm Beach County public health system, caution should be exercised when reviewing results. A low-performance score may not necessarily indicate that improvement is warranted, nor does a highperformance score indicate that there is no need for improvement. These scores are provided as guidelines. Stakeholders and partners should review and discuss these scores to effectively identify strategies for improvement.

This assessment utilizes input from a diverse set of stakeholders that comprise the local public health system in Palm Beach County. Each stakeholder contributes a unique perspective, experience, and set of expertise. Therefore, this process of information gathering incorporates an element of subjectivity and bias. These limitations can be minimized through the use of particular methods; however, the assessment methods are not fully standardized, and these differences may introduce an element of measurement error. Due to these inherent limitations, the results below and associated recommendations should be used only for quality and performance improvement purposes and should not be interpreted to reflect the capacity of performance or priorities of any single agency or organization.

## Results

The Local Public Health System Assessment asks the question "How well is the local public health system performing the ten Essential Public Health Services?" The table and figure below provide an overview of the Palm Beach County local public health system's performance in each of the 10 Essential Public Health Services, as assessed by stakeholders in Palm Beach County. Assessment was completed through the Performance Assessment (Performance Score listed on the table below), the Priority of Model Standards Questionnaire (Priority Rating listed on the table below), and the Local Health Department Contribution Questionnaire (Agency Contribution Scores listed on the table below).

As depicted in the table, the average overall performance score was 78.3 and the average overall priority rating was 8.9. Lastly, the average overall agency (local health department) contribution score was 88.5 among all assessed Essential Service areas. Additionally, Figure 191 below depicts the average scores (colored bars) as compared to the range of performance score responses from participants (black line). The following sections provide details related to these assessments and their results, as well as recommendations for consideration based on the National Public Health Performance Standards assessment tool.

Table 324: Overall Performance, Priority, and Contribution Scores by Essential Public Health Service

| Model Standards by Essential Services | Performance <br> Scores | Priority Rating | Agency <br> Contribution <br> Scores |
| :--- | ---: | ---: | ---: |
| ES 1: Monitor Health Status | 97.2 | 9.0 | 100.0 |
| ES 2: Diagnose and Investigate | 97.9 | 9.3 | 91.7 |
| ES 3: Educate/Empower | 61.1 | 9.0 | 100.0 |
| ES 4: Mobilize Partnerships | 64.6 | 9.0 | 100.0 |
| ES 5: Develop Policies/Plans | 100.0 | 9.0 | 100.0 |
| ES 6: Enforce Laws | 94.4 | 8.7 | 75.0 |
| ES 7: Link to Health Services | 59.4 | 9.5 | 87.5 |
| ES 8: Assure Workforce | 61.3 | 9.0 | 81.3 |

## Performance Assessment Results

The following section provides detailed information on the performance ratings of each Essential Service and accompanying Model Standards. The collective scores for the Model Standards under each Essential Service are provided, as are the themes related to strengths, opportunities, and/or recommendations for improvement within the public health system, as discussed by participants during the Local Public Health System Assessment sessions.

## Performance Assessment Results: Essential Public Health Service 1 - Monitor Health Status

The local public health system strengths in this area were as follows:

- Palm Beach County's Community Health Assessment is completed every five years using primary and secondary qualitative data, including focus groups, key informant interviews, and the Local Public Health System Assessment process.
- The Community Health Assessment is utilized by numerous partnering organizations in defining organizational strategic objectives and applying for funding to bolster social service and public health programs in the county.
- The Community Health Assessment and its associated process have focused on health equity in recent years. Additionally, infographics, graphs, and summary pages have been developed to educate the community on these findings.
- The local public health system has worked to increase data visualization and associated racial and ethnic disaggregation in epidemiological data, infant mortality data, opioid use data, and other complex public health data that is presented to the public.
- Additional surveillance is conducted and utilized at the local level.
- The Community health Improvement Plan is informed by the findings of the Community Health Assessment.

Overall, according to the assessment, the local public health system in Palm Beach County does optimal activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is an opportunity to improve information dissemination regarding the Community Health Assessment and associated findings with the general public and community, including within the local Department of Health and the local public health system, ensuring that this information is reaching the public at large, and presentations are understandable and relatable.

Table 325: Essential Service 1 Summary of Performance Measures
ESSENTIAL SERVICE 1: Monitor Health Status to Identify Community Health Problems

| 1.1 | Model Standard: Population-Based Community Health Assessment (CHA) <br> At what level does the local public health system: |  |
| :---: | :--- | :---: |
| 1.1 .1 | Conduct regular community health assessments? | 100 |
| 1.1 .2 | Continuously update the community health assessment with current information? | 100 |

|  | Promote the use of the community health assessment among community members and <br> partners? | 100 |
| :---: | :--- | :---: |
| 1.2 | Model Standard: Current Technology to Manage and Communicate Population Health Data <br> At what level does the local public health system: |  |
| 1.2 .1 | Use the best available technology and methods to display data on the public's health? | 75 |
| 1.2 .2 | Analyze health data, including geographic information, to see where health problems <br> exist? | 100 |
| 1.2 .3 | Use computer software to create charts, graphs, and maps to display complex public <br> health data (trends over time, sub-population analyses, etc.)? | 100 |
| 1.3 | Model Standard: Maintenance of Population Health Registries <br> At what level does the local public health system: | 100 |
| 1.3 .1 | Collect data on specific health concerns to provide the data to population health registries <br> in a timely manner, consistent with current standards? | 100 |
| 1.3 .2 | Use information from population health registries in community health assessments or <br> other analyses? | ( |

## Performance Assessment Results: Essential Public Health Service 2 - Diagnose and Investigate

The local public health system strengths in this area were as follows:

- The development of detailed emergency plans that are tested through drills for various emergency and hazard situations.
- The establishment of strong, collaborative coordination among county partners, which has been essential in the COVID-19 pandemic response.
- The expansion of the local public health system in Palm Beach County, which ensures a far reach and touches many community members through the work of private, nonprofit, and governmental organizations.

Overall, according to the assessment, the local public health system in Palm Beach County does optimal activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is an opportunity to increase communication among partners. Increased communication in this area can serve to establish consistent public health and emergency responses and increase collaboration among agencies.

## Table 326: Essential Service 2 Summary of Performance Measures

## ESSENTIAL SERVICE 2: Diagnose and Investigate Health Problems and Health Hazards

| 2.1 | Model Standard: Identification and Surveillance of Health Threats <br> At what level does the local public health system: |  |
| :---: | :--- | :---: |
| 2.1 .1 | Participate in a comprehensive surveillance system with national, state and local <br> partners to identify, monitor, share information, and understand emerging health <br> problems and threats? | 100 |
| 2.1 .2 | Provide and collect timely and complete information on reportable diseases and <br> potential disasters, emergencies and emerging threats (natural and manmade)? | 100 |
| 2.1 .3 | Assure that the best available resources are used to support surveillance systems <br> and activities, including information technology, communication systems, and <br> professional expertise? | 100 |
| 2.2 | Model Standard: Investigation and Response to Public Health Threats and Emergencies <br> At what level does the local public health system: |  |
| 2.2 .1 | Maintain written instructions on how to handle communicable disease outbreaks <br> and toxic exposure incidents, including details about case finding, contact tracing, <br> and source identification and containment? | 100 |

|  | 2.2.2 | Develop written rules to follow in the immediate investigation of public health threats <br> and emergencies, including natural and intentional disasters? |
| :---: | :--- | :---: |
| 2.2 .3 | Designate a jurisdictional Emergency Response Coordinator? | 100 |
| 2.2 .4 | Prepare to rapidly respond to public health emergencies according to emergency <br> operations coordination guidelines? | 100 |
| 2.2 .5 | Identify personnel with the technical expertise to rapidly respond to possible <br> biological, chemical, or and nuclear public health emergencies? | 100 |
| 2.2 .6 | Evaluate incidents for effectiveness and opportunities for improvement? | 100 |
| 2.3 | Model Standard: Laboratory Support for Investigation of Health Threats <br> At what level does the local public health system: | 100 |
| 2.3 .1 | Have ready access to laboratories that can meet routine public health needs for <br> finding out what health problems are occurring? | 100 |
| 2.3 .2 | Maintain constant (24/7) access to laboratories that can meet public health needs <br> during emergencies, threats, and other hazards? | 75 |
| 2.3 .3 | Use only licensed or credentialed laboratories? | 100 |
| 2.3 .4 | Maintain a written list of rules related to laboratories, for handling samples <br> (collecting, labeling, storing, transporting, and delivering), for determining who is in <br> charge of the samples at what point, and for reporting the results? | 100 |

## Performance Assessment Results: Essential Public Health Service 3 - Inform, Educate, and Empower

The local public health system strengths in this area were as follows:

- The Department of Health consistently presents public health data to the County Commissioners to inform the decision-making process at the local level.
- A wide network of community partners is often utilized to disseminate public health information from the Department of Health.
- The Palm Beach County Community Health Improvement Plan (CHIP) Advisory Council establishes a collective set of public health priorities.

Overall, according to the assessment, the local public health system in Palm Beach County does significant activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- Improving communication regarding health issues and priorities through consistent messaging from across agencies and sectors
- Increasing efforts to educate and inform the most vulnerable and hard to reach populations within the community.

Table 327: Essential Service 3 Summary of Performance Measures
ESSENTIAL SERVICE 3: Inform, Educate, and Empower People about Health Issues

| 3.1 | Model Standard: Health Education and Promotion <br> At what level does the local public health system: | 75 |
| :---: | :--- | :---: |
| 3.1 .1 | Provide policymakers, stakeholders, and the public with ongoing analyses of <br> community health status and related recommendations for health promotion <br> policies? | 50 |
| 3.1 .2 | Coordinate health promotion and health education activities to reach individual, <br> interpersonal, community, and societal levels? | 50 |
| 3.1 .3 | Engage the community throughout the process of setting priorities, developing plans <br> and implementing health education and health promotion activities? | 50 |
| 3.2 | Model Standard: Health Communication <br> At what level does the local public health system: | 50 |
| 3.2 .1 | Develop health communication plans for relating to media and the public and for <br> sharing information among LPHS organizations? | 50 |
| 3.2 .2 | Use relationships with different media providers (e.g. print, radio, television, and the <br> internet) to share health information, matching the message with the target <br> audience? | 5 |
| 3.2 .3 | ldentify and train spokespersons on public health issues? | 50 |

| 3.3 | Model Standard: Risk Communication <br> At what level does the local public health system: |  |
| :---: | :--- | :--- |
| 3.3 .1 | Develop an emergency communications plan for each stage of an emergency to <br> allow for the effective dissemination of information? | 100 |
| 3.3 .2 | Make sure resources are available for a rapid emergency communication response? | 75 |
| 3.3 .3 | Provide risk communication training for employees and volunteers? | 50 |

## Performance Assessment Results: Essential Public Health Service 4 - Mobilize Community Partnerships

The local public health system strengths in this area were as follows:

- The local public health system maintains a directory of health and human service community organizations throughout the county. This directory is available online for increased access.
- The Palm Beach County CHIP Advisory Council has increased communication and partnership among agencies and has introduced new partners over time.

Overall, according to the assessment, the local public health system in Palm Beach County does significant activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is opportunity for increased resident participation in the establishment of community health improvement goals.
- While many agencies collaborate to achieve the common goals of the local public health system, there is opportunity for additional agencies to work together to reach those who are currently underserved.

Table 328: Essential Service 4 Summary of Performance Measures

ESSENTIAL SERVICE 4: Mobilize Community Partnerships to Identify and Solve Health Problems

| 4.1 | Model Standard: Constituency Development <br> At what level does the local public health system: |  |
| :---: | :--- | :---: |
| 4.1.1 | Maintain a complete and current directory of community organizations? | 75 |
| 4.1 .2 | Follow an established process for identifying key constituents related to overall public <br> health interests and particular health concerns? | 50 |
| 4.1 .3 | Encourage constituents to participate in activities to improve community health? | 75 |
| 4.1 .4 | Create forums for communication of public health issues? | 50 |
| 4.2 | Model Standard: Community Partnerships <br> At what level does the local public health system: |  |
| 4.2 .1 | Establish community partnerships and strategic alliances to provide a comprehensive <br> approach to improving health in the community? | 75 |
| 4.2 .2 | Establish a broad-based community health improvement committee? | 75 |
| 4.2 .3 | Assess how well community partnerships and strategic alliances are working to <br> improve community health? | 50 |

[^241]
## Performance Assessment Results: Essential Public Health Service 5 - Develop Policies and Plans

The local public health system strengths in this area were as follows:

- The Florida Department of Health in Palm Beach County is an Accredited Health Department through the Public Health Accreditation Board (PHAB).
- The Florida Department of Health in Palm Beach County has established programs and processes to ensure the essential public health services are consistently provided, regardless of funding changes.
- A wide range of partners utilize the Palm Beach County Community Health Improvement Plan (CHIP), which is updated frequently with data and progress reports. The CHIP findings and defined strategies inform strategic goals for several community partners.
- The Florida Department of Health in Palm Beach County established emergency plans that are updated consistently and are practiced through scheduled drills with county partners.

Overall, according to the assessment, the local public health system in Palm Beach County does optimal activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is an opportunity to further share the CHIP progress with residents and community members to inform them of the work being done to improve health throughout the county.
- There is also opportunity for the local public health system to further engage in the policy-making process. At this time, the Florida Department of Health in Palm Beach County provides data and public health information to the local government as appropriate to inform the decision-making process. However, active involvement in policy development is limited across the local public health system.

Table 329: Essential Service 5 Summary of Performance Measures

| 5.1 | Model Standard: Governmental Presence at the Local Level At what level does the local public health system: |  |
| :---: | :---: | :---: |
| 5.1.1 | Support the work of a local health department dedicated to the public health to make sure the essential public health services are provided? | 100 |
| 5.1.2 | See that the local health department is accredited through the national voluntary accreditation program? | 100 |
| 5.1.3 | Assure that the local health department has enough resources to do its part in providing essential public health services? | 100 |
| 5.2 | Model Standard: Public Health Policy Development At what level does the local public health system: |  |
| 5.2.1 | Contribute to public health policies by engaging in activities that inform the policy development process? | 100 |

|  | 5.2.2 | Alert policymakers and the community of the possible public health impacts (both <br> intended and unintended) from current and/or proposed policies? |
| :--- | :--- | :---: |
| 5.2 .3 | Review existing policies at least every three to five years? | 100 |
| 5.3 | Model Standard: Community Health Improvement Process and Strategic Planning <br> At what level does the local public health system: | 100 |
| 5.3 .1 | Establish a community health improvement process, with broad- based diverse <br> participation, that uses information from both the community health assessment and <br> the perceptions of community members? | 100 |
| 5.3 .2 | Develop strategies to achieve community health improvement objectives, including a <br> description of organizations accountable for specific steps? | 100 |
| 5.3 .3 | Connect organizational strategic plans with the Community Health Improvement Plan? | 100 |
| 5.4 | Model Standard: Plan for Public Health Emergencies <br> At what level does the local public health system: | 100 |
| 5.4 .1 | Support a workgroup to develop and maintain preparedness and response plans? | 100 |
| 5.4 .2 | Develop a plan that defines when it would be used, who would do what tasks, what <br> standard operating procedures would be put in place, and what alert and evacuation <br> protocols would be followed? | Test the plan through regular drills and revise the plan as needed, at least every two <br> years? |
|  |  | 100 |

## Performance Assessment Results: Essential Public Health Service 6 - Enforce Laws and Regulations

The local public health system strengths in this area were as follows:

- The Florida Department of Health in Palm Beach County leads a number of regulatory initiatives in the county, including those related to Environmental Health.
- Many agencies within the local public health system have access to legal counsel, either on staff or on a voluntary basis, which can provide technical assistance as needed.
- The Florida Department of Health in Palm Beach County, including the various divisions such as Environmental Health and Epidemiology, present public health information to local leaders, providers, businesses, and constituents to inform the decision-making process related to public health policies and concerns.

Overall, according to the assessment, the local public health system in Palm Beach County does optimal activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- At certain times, especially during the COVID-19 pandemic, public health regulations and ordinances have not been consistent at the national, state, county, and organizational levels. An opportunity exists to increase cooperation among various levels of the public health system to align these regulations in an effort to increase resident understanding and cooperation.

## Table 330: Essential Service 6 Summary of Performance Measures

ESSENTIAL SERVICE 6: Enforce Laws and Regulations that Protect Health and Ensure Safety

| 6.1 | Model Standard: Review and Evaluation of Laws, Regulations, and Ordinances <br> At what level does the local public health system: |  |
| :--- | :--- | :---: |
| 6.1 .1 | Identify public health issues that can be addressed through laws, regulations, or <br> ordinances? | 100 |
| 6.1 .2 | Stay up-to-date with current laws, regulations, and ordinances that prevent, promote, <br> or protect public health on the federal, state, and local levels? | 100 |
| 6.1 .3 | Review existing public health laws, regulations, and ordinances at least once every <br> five years? | 100 |
| 6.1 .4 | Have access to legal counsel for technical assistance when reviewing laws, <br> regulations, or ordinances? | 100 |
| 6.2 | Model Standard: Involvement in the Improvement of Laws, Regulations, and Ordinances <br> At what level does the local public health system: |  |

$\begin{array}{|l|l|c|}$\cline { 2 - 3 } \& 6.2.1 \& \(\left.$$

| 6.3 .3 | Assure that all enforcement activities related to public health codes are done within <br> the law? |
| 6.3 .4 | Educate individuals and organizations about relevant laws, regulations, and <br> ordinances? |
| 6.3 .5 | Evaluate how well local organizations comply with public health laws? |

[^242]
## Performance Assessment Results: Essential Public Health Service 7 - Link and Assure Provision of Services

The local public health system strengths in this area were as follows:

- Agencies within Palm Beach County's local public health system work directly with residents to assist those in need with benefit applications, such as Medicaid or SNAP.
- The initiation of the Unite Us system for social service referrals has served as a collaborative effort to increase linkages to care.
- A number of organizations in Palm Beach County provide language services to meet the unique linguistic needs of various populations.

Overall, according to the assessment, the local public health system in Palm Beach County does significant activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is opportunity to further enhance linkages to services for residents in need. The group emphasized that linkages to care cannot end at the referral step. Instead, residents must be successfully connected to the care they need.
- While the identification of populations at increased risk has been relatively well accomplished in Palm Beach County, an opportunity exists to better reach these populations with tailored approaches to successfully link them to care and services. In this assessment, increased access to care was identified as an area in which the local public health system should focus efforts for underserved or overlooked communities to fill gaps in unmet needs.

## Table 331: Essential Service 7 Summary of Performance Measures

ESSENTIAL SERVICE 7: Link People to Needed Personal Health Services and Assure the Provision of Health Care when Otherwise Unavailable

| 7.1 | Model Standard: Identification of Personal Health Service Needs of Populations <br> At what level does the local public health system: |  |
| :---: | :--- | :---: |
| 7.1 .1 | Identify groups of people in the community who have trouble accessing or connecting <br> to personal health services? | 75 |
| 7.1 .2 | Identify all personal health service needs and unmet needs throughout the <br> community? | 50 |
| 7.1 .3 | Defines partner roles and responsibilities to respond to the unmet needs of the <br> community? | 50 |
| 7.1 .4 | Understand the reasons that people do not get the care they need? | 75 |
| 7.2 | Model Standard: Assuring the Linkage of People to Personal Health Services <br> At what level does the local public health system: |  |
| 7.2 .1 | Connect (or link) people to organizations that can provide the personal health services <br> they may need? | 75 |

|  | 7.2 .2 | Help people access personal health services, in a way that takes into account the <br> unique needs of different populations? |
| :--- | :--- | :---: |
| 7.2 .3 | Help people sign up for public benefits that are available to them (e.g., Medicaid or <br> medical and prescription assistance programs)? | 50 |
| 7.2 .4 | Coordinate the delivery of personal health and social services so that everyone has <br> access to the care they need? | 50 |

## Performance Assessment Results: Essential Public Health Service 8 - Assure a Competent Workforce

The local public health system strengths in this area were as follows:

- Workforce assessments are done in the local public health system, including assessments analyzing the number of jobs and students in sectors to identify gaps.
- Training programs and grants are available for students in high schools and universities/colleges.
- Cultural Competency trainings have occurred at increased intervals over the last few years.
- Various organizations throughout the Palm Beach County local public health system frequently offer each other trainings and opportunities for continuing education.
- Multiple leadership development opportunities exist within the county, including programs for residents, leaders, and nonprofit staff.

Overall, according to the assessment, the local public health system in Palm Beach County does significant activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is an opportunity to increase communication and reporting around workforce assessments in the larger local public health system. Many agencies complete this work individually, but increased communication on county-wide results would benefit partners.
- There is also an opportunity for agencies to increase collaboration and communication regarding certifications, education, and license requirements. While many agencies were confident in their own practices, they were unsure of these in other organizations.
- Increased training opportunities for community health workers are needed in the local public health system.

Table 332: Essential Service 8 Summary of Performance Measures
ESSENTIAL SERVICE 8: Assure a Competent Public and Personal Health Care Workforce

| 8.1 | Model Standard: Workforce Assessment, Planning, and Development <br> At what level does the local public health system: |  |

| 8.4 .3 | Ensure that organizations and individuals have opportunities to provide leadership in <br> areas where they have knowledge, skills, or access to resources? | 75 |
| 8.4 .4 | Provide opportunities for the development of leaders representative of the diversity <br> within the community? | 75 |

[^243]
## Performance Assessment Results: Essential Public Health Service 9 - Evaluate Effectiveness, Accessibility, and Quality

The local public health system strengths in this area were as follows:

- The local public health system uses national and state licensure guidelines to ensure quality services throughout the local public health system.
- The local public health system reevaluated effectiveness, accessibility, and quality of services based on the priorities and goals of the Community Health Improvement Plan and the data associated with the Community Health Assessment.
- The local public health system has developed specific programming to increase outreach to vulnerable populations.
- The Unite Us initiative has increased coordination among partners as a service coordination and referral system.

Overall, according to the assessment, the local public health system in Palm Beach County does significant activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is opportunity to ensure that program delivery does reach those that are in the most need. Partners expressed a need to better reach and serve vulnerable populations.
- Additionally, opportunities exist for agencies within the local public health system to share and collaborate on evaluation findings from their own individual organization to enhance the local public health system as a whole.

## Performance Assessment Results: Essential Public Health Service 10 - Research and Innovation

The local public health system strengths in this area were as follows:

- Geospatial mapping and targeted health education interventions for vaccine hesitancy occurred during the COVID-19 pandemic and continue to occur in other public health topic areas.
- Focus groups are conducted on various community health issues, particularly with Family Planning efforts, research topics, and community health assessments.
- Many agencies in the local public health system have established relationships with local academic institutions for internship programs and research.

Overall, according to the assessment, the local public health system in Palm Beach County does optimal activity to meet the performance standards in this area, but the following areas were highlighted as opportunities to improve:

- There is an opportunity to share research findings and efforts with the broader community to educate residents and partners on the work being done in this area of the local public health system.
- Additional opportunities exist for agencies within the local public health system to actively approach schools regarding the availability of internship and research opportunities on a more frequent basis.
- Opportunities exist for local public health system organizations to incorporate research into staff positions, allowing staff the time and resources to conduct research as a role within their agency.

## Priority of Model Standards Questionnaire

As a supplement to the Performance Assessment scoring, local public health stakeholders in Palm Beach County completed a Priority of Model Standards Questionnaire. This questionnaire allowed participants to provide individual priority rankings for each Model Standard and compare priority rankings to Local Public Health System Assessment (LPHSA) performance scores. Surveys were distributed electronically to all external LPHSA meeting participants after the January 28, 2022 LPHSA session.

The below figure depicts the ranking structure established by the National Public Health Performance Standards guidelines and tools. The four quadrants in the figure are determined by the resultant aggregate priority rankings of the Model Standards for the Essential Services, as compared to the corresponding performance score. These results may aid in pinpointing recommended areas of high priority for improvement within the local public health system.

Figure 192: Priority of Model Standards Questionnaire Ranking Guidelines

| Quadrant A | (High Priority and Low Performance) - These activities may need <br> increased attention. |
| :---: | :--- |
| Quadrant B | (High Priority and High Performance) - These activities are being done <br> well, and it is important to maintain efforts. |
| Quadrant C | (Low Priority and High Performance) - These activities are being done <br> well, consideration may be given to reducing effort in these areas. |
| Quadrant D | (Low Priority and Low Performance) - These activities could be <br> improved, but are of low priority. They may need little or no attention at <br> this time. |

## Priority of Model Standards Questionnaire Results

The following table displays the priority rating based on the Priority Model of Standards Questionnaire, as compared to the Performance Assessment score from the LPHSA, for each Essential Service's Model Standard.

Model Standards within Quadrant A are considered to be high priority areas based on the Priority of Model Standards Questionnaire with low performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities may need increased attention in Palm Beach County's local public health system. These Model Standards included areas of evaluation, workforce development, successful linkage to services, mobilizing community partnerships, and areas of health education and information.

Model Standards within Quadrant B are considered to be high priority areas based on the Priority of Model Standards Questionnaire with high performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities are being done well in Palm Beach County's local public health system, and it is important to maintain efforts in these areas due to their high priority ranking. These Model Standards included areas of laws and regulations, policy and plan development, health hazard identification and investigation, and community health assessments.

Model Standards within Quadrant C are considered to be low priority areas based on the Priority of Model Standards Questionnaire with high performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities are being done well in Palm Beach County's local public health system, and consideration may be given to reducing efforts in these areas due to low priority ranking. These Model Standards included research and innovation and enforcement of laws, regulations, and ordinances.
2022 Palm Beach County, Florida Community Health Assessment

Lastly, Model Standards within Quadrant D are considered to be low priority areas based on the Priority of Model Standards Questionnaire with low performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities could be improved in Palm Beach County's local public health system, but due to low priority ranking, they may need little to no attention at this time. The Model Standard highlighted in this area included the local public health system's capacity to initiate or participate in research.

Table 335: Summary of Priority Model Standards Questionnaire Results, By Priority Rating and Performance Score of Model Standards

| Quadrant | Model Standard | Performance Score | Priority Rating |
| :--- | :--- | ---: | ---: |
| Quadrant A | 9.3 Evaluation of LPHS | $68.8 \%$ | 9 |
| Quadrant A | 9.2 Evaluation of Personal Health | $55.0 \%$ | 9 |
| Quadrant A | 9.1 Evaluation of Population Health | $62.5 \%$ | 9 |
| Quadrant A | 8.4 Leadership Development | $75.0 \%$ | 9 |
| Quadrant A | 8.3 Continuing Education | $70.0 \%$ | 9 |
| Quadrant A | 8.2 Workforce Standards | $75.0 \%$ | 9 |
| Quadrant A | 8.1 Workforce Assessment | $25.0 \%$ | 9 |
| Quadrant A | 7.2 Assure Linkage | $56.3 \%$ | 9 |
| Quadrant A | 7.1 Personal Health Services Needs | $62.5 \%$ | 10 |
| Quadrant A | 4.2 Community Partnerships | $66.7 \%$ | 9 |
| Quadrant A | 4.1 Constituency Development | $62.5 \%$ | 9 |
| Quadrant A | 3.3 Risk Communication | $75.0 \%$ | 9 |
| Quadrant A | 3.2 Health Communication | $50.0 \%$ | 9 |
| Quadrant A | 3.1 Health Education/Promotion | $58.3 \%$ | 9 |
| Quadrant B | 6.2 Improve Laws | $83.3 \%$ | 9 |
| Quadrant B | 6.1 Review Laws | $100.0 \%$ | 9 |
| Quadrant B | 5.4 Emergency Plan | $100.0 \%$ | 9 |
| Quadrant B | 5.3 CHIP/Strategic Planning | $100.0 \%$ | 9 |
| Quadrant B | 5.2 Policy Development | $100.0 \%$ | 9 |
| Quadrant B | 5.1 Governmental Presence | $100.0 \%$ | 9 |
| Quadrant B | 2.3 Laboratories | $93.8 \%$ | 9 |
| Quadrant B | 2.2 Emergency Response | $100.0 \%$ | 9 |
| Quadrant B | 2.1 Identification/Surveillance | $100.0 \%$ | 10 |
| Quadrant B | 1.3 Registries | $100.0 \%$ | 9 |
| Quadrant B | 1.2 Current Technology | $91.7 \%$ | 9 |
| Quadrant B | 1.1 Community Health Assessment | $100.0 \%$ | 9 |
| Quadrant C | 10.2 Academic Linkages | $100.0 \%$ | 9 |
| Quadrant C | 10.1 Foster Innovation | $93.8 \%$ | 8 |
| Quadrant C | 6.3 Enforce Laws | $100.0 \%$ | 8 |
|  |  | 8 |  |

| Quadrant D | 10.3 Research Capacity | $62.5 \%$ | 7 |

In addition to the Performance Assessment scoring and the Priority of Model Standards Questionnaire, the Local Health Department (LHD) Contribution Questionnaire was used to further analyze the local public health system in Palm Beach County. This questionnaire allowed participants to provide an individual assessment of the contribution of the local health department to each Model Standard. Surveys were distributed electronically to all internal LPHSA meeting participants after the January 18, 2022 LPHSA session.

The below figure depicts the ranking structure for the Local Health Department Contribution Questionnaire established by the National Public Health Performance Standards guidelines and tools. The four quadrants in the figure are determined by the performance rating of each Essential Service area and associated Model Standard compared to the respective contribution of the local health department in that area, as scored by the questionnaire aggregate results.

Figure 193: Local Health Department Contribution Questionnaire Ranking Guidelines

## Local Health Department Contribution Questionnaire Results

The following table displays the priority ranking based on the Local Health Department (LHD) Contribution Questionnaire, as compared to the Performance Assessment score from the LPHSA (Local Public Health System Assessment), for each Essential Service's Model Standard.

Model Standards within Quadrant A are considered to be areas with high agency contribution based on the Local Health Department Contribution Assessment and low performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities may need increased attention in Palm Beach County's local public health system. These Model Standards included areas of public health workforce standards, identification of personal health service needs, mobilizing community partnerships, and health education and communication.

Model Standards within Quadrant B are considered to be areas with high agency contribution based on the Local Health Department Contribution Assessment and high performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities are being done well in Palm Beach County's local public health system, and it is important to maintain efforts in these areas. These Model Standards included areas of monitoring health status to identify community health problems, diagnosing and investigating health problems and health hazards, and developing policies and plans that support individual and community health efforts.

Model Standards within Quadrant C are considered to be areas with low agency contribution based on the Local Health Department Contribution Assessment and high performance based on the LPHSA. Based on the National

Public Health Performance Standards ranking guidelines, these activities are being done well in Palm Beach County's local public health system, and consideration may be given to reducing efforts in these areas. These Model Standards included areas of research and innovation, enforcement of laws, regulations, and ordinances, and laboratory support.

Lastly, Model Standards within Quadrant D are considered to be areas with low agency contribution based on the Local Health Department Contribution Assessment and low performance based on the LPHSA. Based on the National Public Health Performance Standards ranking guidelines, these activities could be improved in Palm Beach County's local public health system, but due to low priority status, they may need little to no attention at this time. These Model Standards included areas of initiating or participating in research, evaluation, workforce development, and successful linkage to services.

Table 336: Local Health Department Contribution Questionnaire Results

| Quadrant | Model Standard | LHD Contribution | Performance Score |
| :---: | :---: | :---: | :---: |

## Conclusion

The process of the Local Public Health System Assessment identified strengths and opportunities for both short-term and long-term improvement in the Palm Beach County local public health system. This process also actively engaged community stakeholders in improvement efforts across the local public health system, further enhancing the current system of support and community resources in the county. This assessment is intended to ultimately help guide planning and collaboration efforts of local health and human services agencies in Palm Beach County to further advance the scope and impact of the local public health system.

# Community Focus Groups 

## Introduction

Between December 2021 and January 2022, the Health Council of Southeast Florida conducted seventeen focus group sessions with 299 participants to gain primary qualitative insights on health in Palm Beach County. These sessions allowed residents to voice their opinions, experiences, and needs related to health in Palm Beach County in a discussion-based format.

## Methodology

Seventeen focus group sessions were conducted over the course of two months, reaching 299 Palm Beach County residents. Sessions lasted approximately 90 minutes and allowed participants to share their experiences and opinions related to health in Palm Beach County through a series of questions and probes. In addition to English language sessions, one session was held in Spanish and one session was held in Haitian Creole. Due to the ongoing COVID-19 pandemic, all sessions were held virtually over Zoom. Registration and technical assistance were provided to all participants who requested it. Participants answered a series of demographic questions upon registration. Upon the start of each session, participants were given an overview of the session goals and community health assessment process, and all participants were assured that no names would be included in the summarization of answers. As a token of appreciation for their time, participants were awarded a $\$ 25$ gift card for their participation in a session.

## Participant Demographics

Results
The following section includes the findings and themes that emerged across all 17 of the Community Health Assessment resident focus groups.

Table 346: Impressions of Health

| Impressions of Health |  |
| :---: | :---: |
| An individual's beliefs and understandings regarding health may influence their perception of health in their community and their actions towards health behaviors in everyday life. According to the Theory of Reasoned Action, an individual's action is most directly influenced by their behavioral intention. Determinants of such behavioral intentions include an individual's subjective norms and attitudes. Research shows that an individual's attitude is determined by their behavioral beliefs about the action, and their subjective norm is determined by their normative beliefs. ${ }^{283}$ As such, it is critical to understand the community's beliefs and understandings related to health in community health assessment efforts. Participants were asked the following questions regarding their current impressions of health and healthy communities. |  |
| Question | Insights and Responses |
| What does health mean to you? | Overall, participants viewed health in a variety of ways, including holistic wellness, healthy eating and active living, and freedom from disease. <br> Holistic wellness <br> - Many participants shared impressions of health as a holistic experience, focusing on balance, happiness, and overall wellbeing. <br> - "Being able to wake up every day and be happy and healthy." <br> - "Health is life. It means being sound in mind and body." <br> - "Health is the ability to live well." <br> - "Health means being stable financially, physically, socially and mentally." <br> Healthy eating and active living <br> - Additionally, participants depicted the value of health in terms of healthy eating and physical activity. As one participant shared, "health means keeping fit, being healthy and having a balanced diet." <br> Being free from disease and illness <br> - Lastly, participants saw health as being free from disease and illness. One participant stated that health is the "absence of disease or disability." |
| When you hear the words "healthy community" what comes to mind? | Participants highlighted access to quality care, services, and resources as a defining factor of healthy communities. Strong social supports, such as education, culture, food security, housing, and transportation were also highlighted. It was clear throughout the sessions that participants did not view health in a singular, medical sense. Many participants spoke to the importance of strong relationships within the community and working together to achieve common goals. Participants also cited environmental |

[^244]

## Current Community Strengths

Community strengths identified by residents can provide insight into what community members perceive to be going well in their community, as well as what they currently value in their neighborhoods. Leaders may use this information to build on current strengths in their efforts to address gaps and opportunities for improvement. Participants answered the following questions about perceived strengths and associated influences on their community.

## Insights and Responses

Participants highlighted programs and services, access to care, and a strong sense of community as strengths in the areas that they live.

## Programs and services

- Participants highlighted programs that have benefited their community, including the BRIDGES program, Go Glades, the Glades Initiative, Caridad, Community Partners, and Henderson Behavioral Health. These programs increased access to necessary resources for residents, making them a valuable asset in improving and maintaining health in Palm Beach County. One participant shared, "having the BRIDGES program in our community is a very great strength. It offers [a] list of resources, grocery assistance [and] parent trainings." Another participant stated, "we have Palm Tran but we also have Go Glades. This is a bus that comes to your door instead of walking to a bus stop. [It] takes us to doctors and drop us off. Glades Initiative has a food bank that opens twice a week." Participants also shared their experiences with the Glades Initiative, stating, "the Glades Initiative brings healthy vegetables and food and juice and, if we need things like appointments, they will reach out to someone in the community to provide those services." Additionally, participants stated, "[we have] Caridad, Community Partners, Henderson Behavioral Health and various food pantries help to contribute to health in the community."
- Other programs and services were also highlighted. One participant stated, "educating the community on the prevention measures, for instance the diabetes prevention program [is helpful]." Participants also highlighted parks, quality educational opportunities and schools, affordable medical and mental health services, programs for seniors and those in need to obtain basic necessities, community infrastructure improvements, employment opportunities and jobs, as well as unemployment assistance programs currently within the community. As one participant stated, "we are constantly evolving our programs to meet the changing needs of local and state agencies, schools, hospitals, underserved families, children and adults."

## Access to care

- Access to affordable healthcare facilities and services were also highlighted as a strength in Palm Beach County communities. Healthcare facilities that were conveniently located and accessible for all populations, regarded as insurance status, were praised. As one participant from the Glades region stated, "[there is] one hospital in Glades for 30,000 residents in the tri-city area. The hospital is very important to us. They expanded to have space for people without insurance to go see a doctor. They also provide dental services in addition to traditional hospital

|  | services." Despite praise in this area, residents throughout the focus groups also emphasized access to care as an opportunity for improvement in communities, especially as it relates to affordability, behavioral health, and specialty care." <br> A sense of community <br> - Participants conveyed a strong sense of community, highlighting the impact this social cohesion has on the health of Palm Beach County. As one participant stated, "our strength is that we believe in unity. We can do anything together." Another participant stated, "There is a sense of belonging in my community people see one another as vital part of the community and this makes it easy to support and help one another." <br> - "We all have access to social amenities and good relationships. We live as one. We come together to the aid of our neighbors." <br> - "Community togetherness, social groups coming together to discuss the common goals of the community and means of achieving them." |
| :---: | :---: |
| Who or what influences what you do (or think) about your health? | When asked who or what influences what participants do or think about their health, participants shared that the following sources influence their decision-making: <br> - Service providers, such as doctors, nutritionists, health workers, healthcare personnel, and therapists <br> - Media sources, such as the Internet and social media platforms <br> - "Our immediate environment - that's out family and friends" <br> - School courses/educational institutions <br> - The government <br> - Personal financial status and health conditions |

Table 348: Opportunities for Improvement

## Opportunities for Improvement

Opportunities for improvement and barriers to health were explored by focus group participants. This information can provide insight into the current gaps in the local public health system, as well as the barriers that may influence those gaps. According to the Health Belief Model, perceived barriers play a critical role in an individual's behavior, and thus their health. As one of the most widely applied behavior theories in health behavior research, the Health Belief Model states that the intentional targeting of perceived barriers, benefits, self-efficacy, and threats will most effectively lead to optimal behavior change. ${ }^{284}$ As such, it is important to understand resident's current perceived gaps and barriers to address health in the community. Participants were asked the following questions about opportunities for improvement in their community.

## Insights and Responses

Participants saw opportunities for improvement in services for special populations, health education, and resources. Throughout the discussion, participants conveyed that increased assistance in these areas would positively benefit the community and impact overall health.

Services for special populations, including seniors, caregivers, immigrants, and the re-entry population

- Participants highlighted a need for additional support services for seniors. One participant stated, "we need more supportive services for seniors." Another shared that "more support services for seniors [are needed]. We do good with Meals on Wheels, but more connections to resources and inclusion with technology [is needed]."
- Participants also shared that additional resources for caregivers would benefit the health of the community. One participant stated, "more support services and policies that benefit caregivers [are needed]." Another shared that "respite for caregivers for those caring for people with dementia [is needed]. Caregivers are often burnt out and need a break. It is financial strain on them."
- Participants also mentioned the need for additional supports for the reentry population. One participant shared, "more support for the reentry population [is needed] - those that were incarcerated and returning back to communities. They need more support reintegrating, such as applying for housing, employment or benefits."
- Participants shared that immigrant populations are often overlooked and need additional assistance programs to improve the health of the community. One participant stated, "A lot of residents are new to the country and need health [resources]. To go to clinics, there is no transportation. They are dependent on friends or family for transportation. There is no assistance for issues with landlords/housing issues. They live in places that are not healthy at all and not healthy for the children. Transportation and housing are the main barriers. [There is] too much abuse from landlords - in one case, landlords won't repair the air conditioning and children get sick, or there are rats in the house. They can't live like that. They complain and the landlords won't help. The city can't help enforce anything with the landlords, and [they] tell them to get a paralegal to fight it. There is a lack of available resources for these kinds of issues." Participants also shared

[^245]2022 Palm Beach County, Florida Community Health Assessment

|  | that these populations are experiencing "difficulty in attaining routine medical care for the undocumented population." <br> Health education <br> - Participants believe increased health education efforts for community members would improve the health of the community. As one participant stated, "what's unavailable in my community is health classes." Additionally, another participant stated that, "public awareness and health education will definitely go a long way." Another participant shared that there is a need for "more health seminars that teach people how to live a healthy life." <br> - Participants also stated "more mental health awareness on its importance." In addition to mental health sessions, participants also suggested nutrition and diet sessions, as well as seminars for pregnant women and families. <br> - Participants also suggested "creating listening sessions and tutoring people how to go about insurance and legal documents especially for people who've are caregivers to people with illnesses" and "information concerning health, safety, and wellness." <br> Resources <br> - Participants shared that additional medical resources are needed. Specifically, participants shared that "a more diverse group of mental health practitioners for adolescents and teens" would be beneficial. Additionally, more qualified healthcare workers, affordable healthcare facilities, free medical check-ups, and additional mental health facilities and providers were noted by participants. One participant also stated that, "[it is] challenging to get contraceptives. We had to look in another community. I also had an issue with PrEP and PEP. I had someone who couldn't get PrEP easily." <br> - Participants shared the need for additional resources in the form of financial planning training, transportation options, affordable and safe housing options, and low-cost gyms or community exercise groups. <br> - The issue of racism in communities was a concern of participants throughout sessions. <br> - Participants from the Glades region shared concerns related to the availability of services and programs, such as specialists, nutritionists, and qualified physical trainers. One participant stated, "we don't have behavioral specialists or mental health facilities or even counseling - we don't have counselors or therapists and those require referrals and travel to West Palm Beach". Glades-region participants also shared the need for improved infrastructure, such as roads, in their community. <br> - "The Latino community sometimes [doesn't] know about all the resources that are available in the community... There is a lot of information in Spanish, but people are not aware." |
| :---: | :---: |
| What health services are unavailable or hard to access? | When asked what health services are unavailable or hard to access, participants shared the following: <br> - Mental health practitioners, including those with cultural diversity <br> - Sexual health specialists and sexual assault specialists <br> - Dental services <br> - Vision services <br> - Surgical procedures |

$\left.\begin{array}{|l|l|l|}\hline & \text { - Transportation services } \\ \text { - Pediatricians } \\ \text { - } \\ \text { - Gynecological services }\end{array}\right]$ Rehabilitation centers

|  | [would help]." Another participant shared, "[there is a] lack of providers in the [Glades region] area - that leads to long travels to providers outside of the area in West Palm Beach. Transportation is a barrier and support in this area [is needed]." <br> - Other resource suggestions included additional recreation center infrastructure, mental health services, financial support programs for healthcare costs, and community health workers to fill the current gaps in healthcare and service delivery. <br> - Participants also recognized the need for additional resources for special populations, such as translation services for those who do not speak English, and services for immigrants such as documentation and employment support services. <br> Employment opportunities <br> - Participants also saw stable, quality employment opportunities as a key area for support that can improve health in the community. <br> - "Increase the rate of employment for residents. Unemployment has contributed a lot to an unhealthy community. When people are earning income, they'll be able to afford health care services and also have access to other facilities that will in turn affect them positively." <br> Policies <br> - Participants shared that support in the form of policies can help improve the health of the community and help residents overcome current barriers. One participant stated, "new policies to stop the housing abuse and mental health support [are needed]. All of these problems effect the families. Stress added on parents as a result of these housing issues makes health worse." |
| :---: | :---: |
| How can residents and community organizations work together to improve the health of the county? | Participants shared that residents and community organizations can work together on policies and support programs, education, and outreach efforts to improve health in Palm Beach County. <br> Policy development and implementation <br> - Participants shared that targeted policy development and implementation could play a significant role in improving the health of the community. <br> - "Enacting policies and programs that serve in the best interests of their health status." <br> - "Hold policy makers accountable and create channels of communication with key policymakers at the local level." <br> Support programs, education, and outreach <br> - Participants valued community-based support programs, educational opportunities, and outreach as methods to improve the health of the community. Throughout discussion, participants shared ideas for ways in which residents and community organizations can work together to deliver needed programming and information dissemination, including the development of support groups, educational workshops, awareness campaigns, surveys, and free counseling and screening opportunities. Participants emphasized the importance of increased |

| Highlighted Issues, Causes, and Affected Populations |  |
| :---: | :---: |
| The goal of a community health assessment is to identify issues and health needs that can be strategically addressed to improve the health of a community. ${ }^{285}$ As such, it is critical to understand residents' impressions of current issues, causes, and affected populations. This insight can help leaders understand the issues most important to community members at this time. Participants were asked the following questions about common issues, causes, and vulnerable populations in their community. |  |
| Question | Insights and Responses |
| What are common health issues that you, your family or your community struggle with? | Participants cited health issues such as substance use, diabetes, cancer, mental health, high blood pressure, and obesity as common health issues experienced in their communities. Below is a list of health issues that participants stated as issues: <br> - Mental and behavioral health issues, such as depression, bipolar disorder, post-traumatic stress disorder, anxiety, attention deficit hyperactivity disorder, and substance use <br> - Respiratory conditions, such as allergies, asthma, pneumonia, and tuberculosis <br> - Poor health status, such as the high prevalence of obesity, high blood pressure/hypertension, high cholesterol, nutritional deficiencies <br> - Conditions related to aging, such as Alzheimer's Disease, dementia, the worsening of ophthalmological health, and arthritis <br> - Chronic health conditions, such as cancer, diabetes, heart disease, stroke, kidney diseases <br> - Infectious diseases, such as COVID-19, HIV/AIDS, Hepatitis, and sexually transmitted infections, food-borne illnesses |
| What do you believe causes the health issues you have described? | Participants cited stress and life events, lifestyles and habits, environmental triggers, and a lack of education or awareness as the causes of the major health issues they see in their community. <br> Stress and life events <br> - A number of participants attributed stress and negative life events as contributing factors to mental health issues. Participants shared experiences of financial hardship, job loss, and work-related stress. Participants also shared that traumatic events also contributed to poor health outcomes. <br> - A majority of participants mentioned that COVID-19 contributed to a number of mental health issues. Participants shared experiences of losing jobs, losing social connections, and facing financial hardships. One participant shared, "for mental health issues such as depression...losing loved ones due to COVID-19 has had a toll on people's mental health... [and] losing jobs." Another participant shared, "the pandemic has made these health issues worse and more prevalent." <br> - A number of participants stated that unemployment contributed to drug use. <br> - Several participants also mentioned an increase in poverty and homelessness, paired with higher costs of medical services, led to an increase of stress and poor health outcomes as it deterred individuals from seeking necessary care |

[^246]|  | Lifestyle and habits <br> - Participants stated that work is often a cause of health issues. One participant stated, "work schedules can compromise health." Participants also shared that during the pandemic, working from home led to more idle time and decreased physical activity. Participants attributed unemployment to decreased physical activity, as well. <br> - Participants highlighted the need for education and guidance when it comes to developing healthy lifestyles, stating "a lack of guidance leads to bad habits, such as drug abuse." A lack of understanding or ignorance to healthy habit development was seen as a contributing factor to poor health outcomes, including 'poor self-monitoring of health." <br> - Participants also attributed unhealthy eating and a lack of physical activity as contributing factors to obesity, in addition to genetics. <br> - Substance use and addictions were seen as contributing factors to negative health outcomes. <br> Environmental triggers or factors <br> - Many participants attributed environmental factors, such as pollution, to asthma in addition to unhealthy living conditions. <br> - Air and water pollution from neighboring industries and unsanitary conditions were seen as a contributor to health issues. One participant shared that "breathing issues and cancer are caused by industries situated near where citizens reside, so the fumes from the industries really cause residents to have health challenges like breathing issues and cancer of the lungs. If the government could compensate citizens to move or shut down the industries because they are really causing issues to the health of the residents. Air quality issues with lung health." <br> - In addition to pollution and unhealthy living conditions, participants also saw a lack of infrastructure that promotes physical activity as a contributing environmental factor to poor health outcomes. One participant shared, "for obesity, one factor that affects is the environment. Not having area parks, sidewalks, and affordable gyms makes it hard for people to be physically active." <br> Lack of education or awareness <br> - Participants cited health literacy issues and a lack of awareness as major causes of health issues in their communities. As one participant stated, "people are not aware of what to do and what not to do to avoid issues." Participants shared that increased knowledge related to prevention measures would help their communities achieve optimum health. Another participant characterized the lack of awareness as a "bad foundation" that contributed to health issues. <br> - Another participant spoke to stigma that stems from misunderstandings of health as a contributor to health issues, stating, "stigma contributes to HIV/AIDS issues, and education would help... In my community, everyone thinks you can only get it from sexual relation..." |
| :---: | :---: |
| Who do you feel struggles the most with these health issues you have described? | Overall, vulnerable populations such as children and teens, elders, low-income and rural communities, and minorities were seen as suffering the most from health issues in Palm Beach County. |

| Healthcare and Health Education Touchpoints |  |
| :--- | :--- |
| Effectively reaching targeted populations is a critical component of influencing and addressing health issues in a <br> community. Leaders must understand where residents go for health care and health information in order to <br> impactully reach these community members. The concept of understanding healthcare and health education <br> touchpoints used by residents and patients, known as Health Information-Seeking Behavior, can impact health <br> marketing and outreach efforts.286 Participants were asked the following questions about where they currently <br> seek health care and health information. |  |
| Question | Insights and Responses |$|$| Where do you get |
| :--- |
| Overall, participants utilized a variety of healthcare touchpoints to receive services, <br> including low-cost options such as local healthcare clinics as well as hospitals, urgent <br> care, family doctors, telehealth, pharmacies and home health aides. Participants also <br> shared that they receive advice and minor services from family members who are <br> nurses or doctors whenever possible. |
|  |
| Healthcare touchpoints |

[^247]
# public health professionals, such as doctors, the local health department, and 

 government health agencies, such as the Centers for Disease Control and Prevention.
## Sources of health information

- Internet searches
- Social media (including Facebook and Twitter) and associated community groups on these platforms. Participants stated that they utilized information posted from both friends and organizations on these platforms.
- Health blogs
- YouTube
- Television/News
- Health podcasts
- Health websites
- Family doctor or primary care doctor
- Friends
- Local clinics
- The local health department
- Community health workers and programs, such as Silver Sneakers
- Government Health Agencies, such as the Centers for Disease Control and Prevention (CDC), World Health Organization, and the Food and Drug Administration (FDA)

## Impact of COVID-19

The COVID-19 pandemic has significantly influenced the way in which community members live, work, and play. Stay-at-home and safer-at-home orders have altered how residents attend work and school, as well as the ways in which they receive health care. Social isolation, economic hardship, limited medical capacity and virtual health care visits, and remote schooling have changed the dynamics in both families and communities and have oftentimes led to increased stress and uncertainty related to once-normal activities. ${ }^{287}$ As such, the most recent data is beginning to show that COVID-19 has had a significant impact on other health indicators since 2020. Participants were asked the following questions regarding the impact of COVID-19 on their family and community, as well as the impact of COVID-19 on their ability to access health and social services.

## Insights and Responses

COVID-19 has significantly impacted the lives of residents throughout Palm Beach County. As one participant shared, "COVID-19 has been the worst thing to happen to my family. I lost [my] job and my parents through COVID." Another participant shared that "it has been a tough one. Places we used to go and people we used to know are strangers. It has been a challenging time. It has brought about shortage of cash. Everything has been on a downward slope and it's been really hard. The effect on my family has been rough but thank god we are forging ahead. Our world came crashing down."

Overall, participants highlighted the pandemic's impacts on daily life and routines, finances, and mental health and emotional well-being as the most significant impact areas from the pandemic.

## Changes to daily life

- Participants emphasized the changes to their everyday routines, such as virtual learning, virtual medical visits, working from home, and the closure of many public spaces. Minimized social gatherings affected the way residents spent their free time and led to increased isolation.
- The emergence of virtual learning required lifestyle and routine adjustments from residents. In addition to the stress it added to family and parents who had to change their schedules and commitments to assist with schooling at home, participants also shared that the impact on the children was significant. One participant shared that virtual schooling "made our kids not like school and fall behind."
- Participants also shared experiences of job loss or changes in employment that led to altered schedules and routines.
- Participants shared that family dynamics have changed due to deaths and increased stress. As on participant stated, "family relationships have been weakened" as a result of the COVID-19 pandemic.

## Financial hardship

- The pandemic led to many participants losing their jobs and facing financial hardships as a result. Other participants reflected on hardships created by the increased cost of living, increased medical costs, and increased cost of medical supplies during the same period as the pandemic.

[^248]|  | - "I lost my job and had a hard time getting unemployment assistance and a new job during the pandemic." <br> - "I lost my job due to COVID, so we are financially unstable." <br> - "[We] used up savings and saved funds." <br> - "When I lost my job, it was a really hard time for me. I was sick and didn't have healthcare anymore." <br> - "[My] family member was affected by COVID-19. They were hurting and in pain and it affected the family with stress and financial strain to take care of them." <br> Mental health and emotional well-being <br> - Participants experienced feelings of fear and anxiety related to worry about contracting the virus. As one participant stated, "I am living in fear." Anxiety and fear were also driven by the "unknown" and "changed lifestyles." One participant shared that "when COVID first hit, no one was sure what to do next. Now we have vaccines and some people won't take the vaccines. I think the major thing that affected me since COVID was the uncertainties about COVID." Feelings of overall "emotional trauma" were shared among the group members. <br> - Participants also conveyed the impact of COVID-19 on their children, stating that increased anxiety in children was an issue. <br> - Feelings of loneliness were also highlighted, with participants sharing experiences of isolation related to working from home, job loss, and limited social gatherings. <br> - Participants shared feelings of depression related to isolation and the loss of loved ones. The replacement of normal social interactions with virtual gatherings and education led to increased feelings of depression for participants. As one participant stated, "...since everyone was on lockdown and couldn't be with family and friends, that brought on anxiety and depression for people." <br> - Participants also relayed experiences of familial tensions, driven by virtual school, working from home, and emotional stress as a result of the pandemic. <br> - In addition to family dynamics being impacted by the pandemic, participants also saw impacts in their overall social circles. One participant shared that the pandemic "changed the whole dynamics of relating to each other." <br> - Participants also highlighted the increased use of substances during the pandemic as a means of coping, saying they saw "increased used of substances just to forget the incident." |
| :---: | :---: |
| How has COVID-19 affected access to health and social services in your community? | When asked about the effect of COVID-19 on access to health and social services, participants focused on the decreased access to traditional services and the increased access to virtual services. <br> Decreased access to traditional services <br> - Participants emphasized that access to services was restricted due to facility closures intended to slow the spread of the virus. This led to reduced appointment availability and longer wait times to receive services. One participant shared that, "it is a longer wait to get to the specialist or primary care doctor. My coworker was trying to get into primary care and they told her 'we will see you in three months." In addition to these delays, participants shared experiences of having their appointments cancelled by doctors, further delaying care. |

| -Participants shared that multiple social service-based programs were <br> permanently closed in their communities due to the pandemic. This limited the <br> access points for necessary resources during the pandemic, when these services <br> were in high-demand. <br> - <br>  <br> Participants also shared experiences of transportation barriers that led to <br> decreased access to services. As one participant stated, "it was hard to get from <br> one place to another due to transportation issues." Another participant stated, <br> "transportation was a mess." This barrier further compounded issues for already- <br> vulnerable populations. One participant shared, "people couldn't take <br> transportation because buses could only have a certain amount of people on the <br> bus. Social services were closed but we were handling everything by phone and <br> giving out resources, but it was very difficult. These people already face barriers <br> and that made it that much harder." <br> - Fear of contracting the virus at a hospital or doctor's office led to participants <br> skipping or postponing preventative care or needed care. This sentiment was <br> extended into the community, with one participant sharing, "when CoVID came, <br> because of the fear one had, everyone was scared that every issue was COVID. <br> People would not help others and they wouldn't get the help they needed from <br> doctors." <br> - Many participants also shared that the healthcare field's focused response on <br> coviD-19 led other medical appointments, such as elective surgeries or <br> routine care, to be delayed by the healthcare provider. One participant <br> shared, "l remember elective procedures were cancelled and there were long <br> waits to see a doctor. Doctors were only seeing emergency patients." Another <br> participant shared, "hospitals admitted few people due to social distancing and <br> this led to some people not getting treatment." In some cases, this resulted in <br> further complications for patients. One participant shared an experience in which <br> "it was difficult for non-COVID related cases and illnesses to be attended to. <br> Several persons died in my community because of neglect." |
| :--- | :--- |
| - Participants also shared experiences of increased health care costs, which |
| further limited their ability to access necessary and preventative services. |
| Increased virtual access |

- Some participants did not feel as though virtual appointments met all of their needs as compared to in-person visits, stating "online checkups were not as effective as personal checkups."

Opinyon OU konte anpil epi li ap ede nou enfòme efò ki ap fèt nan sante, yon fason pou yo amelyore sante nan Konte Palm Beach, epi fè yon enpak pozitif nan kominote w la!

Pou kesyon oswa èd nan anrejistreman an, tanpri voye yon imel ban nou nan planning@hcsef.org

## Key Informant Interviews

## Introduction

The Health Council of Southeast Florida conducted 15 interviews with key community stakeholders and members in 2022. The purpose was to collect first-hand information from a wide range of community leaders who have expertise about the county, its residents and its resources. The individuals selected for the interviews included leaders, representatives, or members of medically underserved, low-income and minority populations, as well as funders, members of law enforcement, and leaders of community organizations. Their expert knowledge and understanding provides insight on the nature of problems and recommendations for solutions and future planning.

## Methodology

The Health Council of Southeast Florida (HCSEF) developed protocols, a script, and questions for key informant interviews. Interview appointments were scheduled and each interview was conducted by a trained facilitator via telephone or the Microsoft Teams platform. The interviews lasted on average 30-45 minutes. Prior to beginning the interview, the facilitator provided an overview of the process and assured the confidentiality of all comments, names and other identifying information during reporting.

Results

Key informant interviews were conducted with 15 key stakeholders throughout January 2022. A total of 15 questions were asked and probes were used to clarify information and glean additional insight. The following information includes the common themes that emerged during the key informant interviews regarding Palm Beach County and from stakeholders living in, serving, and representing the Palm Beach County communities.

Table 352: Key Informant Interviews

| Topic Area | Emergent Themes |
| :--- | :--- |
| Key Health Issues | All key informants mentioned that Palm Beach County residents <br> struggle with chronic health conditions, such as diabetes, high <br> blood pressure, heart disease, obesity and cancer |
|  | The majority of key informants stated that there has been an <br> increase of mental and behavioral health issues throughout the <br> county, especially as a result of the COVID-19 pandemic. Key <br> informants specifically mentioned an increased lack of hope, <br> anxiety, depression, suicide ideation, trauma, untreated psychiatric <br> conditions, and substance use. Several key informants also <br> highlighted stigma related to mental health, one pointing out that it <br> is an issue particularly among Black male residents |
|  | A few key informants specifically called out the generational <br> trauma and weathering that Black residents, particularly <br> American-born Black residents, experience due to anti-Black <br> systemic racism as a major social determinant of health |

|  | - The majority of key informants also mentioned the impact of the built environment on health, including the presence of food deserts, lack of walkable green spaces, and, in the Glades Region, the burning of sugar cane and poor housing infrastructure |
| :---: | :---: |
| Populations with Unmet Needs | - Key informants listed several populations in Palm Beach County with unmet needs, including: <br> - Specific racial and ethnic groups: Black and African American residents, Haitian residents, and Hispanic residents <br> - Specific age groups and dynamics: the senior population, single parents, and children who are born in areas with less opportunity <br> - Specific key populations: migrant farmworkers, individuals who face residential segregation and income inequality, low-income families, and immigrant residents <br> - Specific neighborhoods: The Glades and Riviera Beach |
| Community Strengths and Assets | - Key informants noted various community strengths and assets within Palm Beach County that contribute to a healthy community. Among the most commonly mentioned strengths and assets were: <br> - The investment of time and resources to providing needed services to disenfranchised communities and improving health - the county is rich in resources in terms of foundations, grant entities, and taxing districts <br> - The strong presence of faith-based organizations and the social support they provide to the community members <br> - The Health Care District of Palm Beach County, the Florida Department of Health in Palm Beach County and the Southeast Florida Behavioral Health Network provision of low-to-no cost services to the county <br> - The School District of Palm Beach County, the $10^{\text {th }}$ largest in the country <br> - Good weather year-round provides an environment where residents are able to be physically active outdoors |
| Challenges and Barriers in Maintaining Health | - Key informants listed several challenges and barriers that Palm Beach County residents face when trying to maintain their health. Among the most commonly reported challenges and barriers were: The lack of economic mobility and financial capital, paired with the fact that there are not enough resources to address high demands <br> - Access to care, particularly the lack of awareness of services, lack of transportation, and lack of convenient access to specialty care in the Western communities, as well as the level of sophistication needed to navigate the health care system <br> - High cost associated with medical appointments, which results in residents seeking emergency care when a |

|  | condition has worsened, paired with insurance-related barriers (e.g., types of insurance accepted) <br> The lived environment - food deserts, unsafe homes, sugar cane burning <br> Health-related behaviors, such as poor eating habits and sedentary lifestyles |
| :---: | :---: |
| Opportunities to Note | - Key informants noted several opportunities for improving health in Palm Beach County. Among the most reported opportunities were: <br> - Letting the community decide the services they need and how they want to receive them and building the capacity for community members to become leaders <br> - Need to engage more diverse groups, such as different faiths, cultures, and the LGBTQ community <br> - The county is resource rich, but disjointed - there is strength in numbers and cross-sector collaboration, but there is a need for increased coordination <br> - There is a huge need for affordable housing and living wages, as the lack thereof serve as major barriers to optimal health |
| Suggestions for Improvement | - In addition to the previously mentioned opportunities for improvement, key informants provided specific suggestions for how to improve the health of Palm Beach County. Among the most commonly reported suggestions were: <br> - Suggestions around increased community organizing and shared leadership, shifting the existing power structures. For instance, the majority of key informants mentioned there need to be more opportunities for residents to provide feedback and input, the community needs to be included in decision-making processes, and the need for the development of shared visions. One key informant stated, "Too many times, funders prescribe services without asking the residents what they want." <br> - Suggestions for building trust with communities through transparency, advocacy, partnerships, and action, as it happens often that residents provide feedback but don't see anything come from it. The general sentiment is "talk is cheap, so show me." <br> - There needs to be more representation in the health care system, with more medical and health professionals reflective of the communities they serve <br> - There is a need for more mobile clinics and services to serve the more remote and underserved areas of the county <br> - One notable mention, although not commonly reported, is to increase hope within communities, as it is the key to improving health through behavior change and the will to live healthier lives |
| COVID-19 Impact | - Key informants revealed that COVID-19 greatly impacted Palm Beach County residents. Impacts most commonly reported include: |

## Conclusion

This report was a collaborative effort by community members with the goal of providing residents access to quality health and human services. This community health needs assessment will provide a better understanding of the health needs in the county and will help guide future planning efforts to improve the overall health and quality of life in Palm Beach County. The data collected and presented throughout this assessment will prove to be a valuable asset to the community as a whole moving forward.
